Documentation

S1KDTOOLS-KHZAE-00000-00 Issue No. 011, 2019-02-08

List of effective data modules

The listed documents are included in issue 011, dated 2019-02-08, of this publication.

C = Changed data module

N = New data module

Highlights

The listed changes are introduced in issue 011, dated 2019-02-08, of this publication.

Data module code	Reason for update
S1KDTOOLS-A-00-00-00-00A-920A-D	Add instructions for installing the pre-compiled packages.
	Add link to xmlsoft.org.
S1KDTOOLS-A-03-00-00-00A-040A-D	Change -r to -x, -x to -D, and add new -r and -d options.
	Fix custom CIR XSL example.

Table of contents

Description

1 General

s1kd-tools are a set of small tools for manipulating S1000D data. They are maintained at https://github.com/kibook/s1kd-tools.

This publication is meant to serve as an example of an S1000D data set produced using these tools. The stylesheets used to produce this PDF can be found at https://github.com/kibook/S1000D-XSL-Stylesheets

Description

1 General

This document gives a basic overview of the relationship of the s1kd-tools to S1000D, and defines some common terms used throughout the s1kd-tools documentation.

2 S1000D

S1000D is "an international specification for the procurement and production of technical publications", part of the S-Series of ILS specifications. The main focus of S1000D is the breakdown and classification of documents in to individual components, called "data modules", which can be re-used in multiple publications. These data modules are typically authored using a set of provided XML schemas, allowing them to be automatically managed in a CSDB and validated against a defined set of project "business rules".

3 s1kd-tools

The **s1kd-tools** are a set of small tools for creating and manipulating S1000D data. They are designed to be used as a standalone method of maintaining a simple S1000D CSDB, in

conjunction with a more typical version control system such as Git or SVN, as a backend to implement a more complex S1000D CSDB, or to support an existing S1000D CSDB already in use by a project.

4 CSDB

Common Source Databases can be implemented in any number of ways. For the purposes of the s1kd-tools, the CSDB is simply a directory within a filesystem. Use of the "File-based transfer" file naming conventions in Chap 7 of the S1000D specification are recommended, and most of the tools will use these conventions when creating or listing CSDB objects represented by files. In order to use these tools in conjuction with other implementations of CSDBs, a project can make use of "transfer packages" also described in Chap 7 to facilitate interchange between the two kinds of CSDB.

5 Relationship to the S1000D process

The s1kd-tools can support multiple parts of the basic S1000D process:

Generation: The generation of new CSDB objects is supported by the s1kd-dmrl tool and the s1kd-new* set of tools. These provide two methods of creating objects, either using a data management requirements list (DMRL) or a more on-the-fly approach using the s1kdnew* tools directly.

The **s1kd-defaults** tool is used to manage the files which contain default metadata for new CSDB objects.

2 Authoring: These tools support the authoring process.

The **s1kd-addicn** tool creates the notation and entity elements to reference an ICN in a data module.

The **s1kd-Is** tool lists data modules within a directory.

The **s1kd-metadata** tool lists and edits S1000D metadata on CSDB objects.

The **s1kd-mvref** tool changes references to one object into references to another.

The **s1kd-ref** tool can be used to quickly insert references to other CSDB objects.

The **s1kd-sns** tool can be used to organize the CSDB using a given SNS structure.

The **s1kd-transform** tool applies XSLT transformations to CSDB objects.

The **s1kd-upissue** tool moves CSDB objects through the standard S1000D workflow, between "inwork" (draft) and "official" states.

3 Validation: These tools all validate different aspects of CSDB objects.

The **s1kd-validate** tool validates CSDB objects according to their S1000D schema and general correctness as XML documents.

The **s1kd-brexcheck** tool validates CSDB objects against a business rules exchange (BREX) data module, which contains the project-defined computable business rules.

The **s1kd-refs** tool lists references in a CSDB object to generate a list of dependencies on other CSDB objects.

4 **Publication:** These tools support the production of publications from a CSDB.

The **s1kd-acronyms** tool can automatically mark up acronyms within data modules, and can also generate lists of acronyms marked up within data modules.

The **s1kd-aspp** tool preprocesses applicability statements in a data module, generating display text and "presentation" applicability statements.

The **s1kd-flatten** tool flattens a publication module and referenced data modules in to a single "deliverable" file for a publishing system.

The **s1kd-fmgen** tool generates front matter data module content from a publication module.

The **s1kd-icncatalog** tool resolves ICN references in objects.

The s1kd-index tool flags index keywords in a data module based on a user-defined list.

The **s1kd-instance** tool produces "instances" of CSDB objects using applicability filtering and/or common information repositories (CIRs).

The s1kd-neutralize tool generates IETP neutral metadata for CSDB objects.

The **s1kd-syncrefs** tool generates the References table within data modules.

The **s1kd-uom** tool converts units of measure used in data modules.

s1kd-tools Building, installing and uninstalling

Data mod	ule/Tech	nical publication Title	
None			

Description

1 General

There are multiple ways to install the s1kd-tools:

- using a package manager and the pre-compiled Debian (.deb) or Red Hat (.rpm) packages
- building from source

2 Using a package manager

Debian (.deb) and Red Hat (.rpm) packages are provided to easily install, upgrade or uninstall the s1kd-tools on Linux systems using a package manager. The examples below focus on the standard dpkg (for Debian-based distributions) and rpm (for Red Hat-based distributions).

2.1 Installing

You can download the latest release of the s1kd-tools from http://khzae.net/1/s1000d/s1kd-tools/releases/latest. Then use one of the following commands to install it:

Debian:

```
# dpkg -i s1kd-tools_[version]_[arch].deb
```

Red Hat:

```
# rpm -i s1kd-tools.[version].[arch].rpm
```

2.2 Uninstalling

To uninstall using the package manager, use one of the following commands:

Debian:

```
# dpkg -r s1kd-tools
```

Red Hat:

```
# rpm -e s1kd-tools
```

3 Building from source

3.1 Requirements

To build the executables:

- coreutils and binutils
- xxd
- libxml2, libxslt, libexslt

To build the documentation from source:

- s1kd2db
- pandoc

3.2 Building and installing

Run the following commands to build the executables, and install both the executables and documentation:

```
$ make
# make install
```

To change where these are installed, specify the PREFIX make variable. The default value of this variable is /usr/local.

For example:

```
# make PREFIX=/usr install
```

3.3 Uninstalling

To uninstall the executables and documentation:

make uninstall

Remember to specify the PREFIX make variable if a different prefix was used during installation.

Description

1 General

This document provides examples of the usage of the s1kd-tools.

The sample commands have been written as they would be used on a Linux or other Unix-like system, but should work more-or-less the same on most operating systems. OS-specific commands used in examples (e.g., mkdir) may need to be adapted.

ICN-S1KDTOOLS-A-000000-A-KHZAE-00002-A-001-01

Fig 1 Example - Authoring with Vim + MuPDF

2 Initial setup

This first step is to create a folder for the new S1000D project. Example:

```
$ mkdir myproject
$ cd myproject
```

After that, you should create two files: .defaults and .dmtypes. These files can be created automatically using the s1kd-defaults tool to initialize the new CSDB:

```
$ s1kd-defaults -i
```

Afterwards, these files can be edited to customize them for your project. More information on the contents of these files is provided below.

Note

If the tools are run in a directory that does not have these configuration files, they will search for them in the parent directories to find the top of the CSDB directory tree.

2.1 .defaults file

The .defaults file is used by all of the s1kd-new* tools. It provides default values for various S1000D metadata. The .defaults file can be written in either a simple text format or an XML format.

Example of simple text format:

```
languageIsoCode en countryIsoCode CA
```

responsiblePartnerCompany khzae.net originator khzae.net

brex MYPRJ-A-00-00-00A-022A-D

techName My project

Example of XML format:

```
<?xml version="1.0"?>
<defaults>
<default ident="languageIsoCode" value="en"/>
<default ident="countryIsoCode" value="CA"/>
<default ident="responsiblePartnerCompany" value="khzae.net"/>
<default ident="originator" value="khzae.net"/>
<default ident="brex" value="MYPRJ-A-00-00-00A-022A-D"/>
<default ident="techName" value="My project"/>
</defaults>
```

2.2 .dmtypes file

The .dmtypes file is used by the **s1kd-newdm** tool. It contains a list of information codes and associated info names and schemas to be used when creating new data modules. Like the .defaults file, it can be written using either the simple text format or XML format.

Example of simple text format:

```
009 frontmatter Table of contents
022 brex Business rules exchange
040 descript Description
130 proced Normal operation
```

Example of XML format:

```
<?xml version="1.0"?>
<dmtypes>
<type infoCode="009" infoName="Table of contents"
schema="frontmatter"/>
<type infoCode="022" infoName="Business rules exchange"
schema="brex"/>
```

```
<type infoCode="040" infoName="Description"
schema="descript"/>
<type infoCode="130" infoName="Normal operation"
schema="proced"/>
</dmtypes>
```

The s1kd-newdm tool contains a default set of information code definitions. This can be used to create a default .dmtypes file by use of the – . (simple text format) or – , (XML) options:

```
$ s1kd-newdm -, > .dmtypes
```

The generated .dmtypes file can then be customized to fit your project.

3 Creating the DMRL and populating the CSDB

The next step is to prepare the Data Management Requirements List (DMRL) for the project. The DMRL will contain a list of all the CSDB objects initially required by your project, and can be used to automatically populate your CSDB.

If you do not already have a DMRL, the **s1kd-newdml** tool can be used to create a new one:

```
$ s1kd-newdml -# MYPRJ-NCAGE-C-2017-00001
```

This would create the file DML-MYPRJ-NCAGE-C-2017-00001_000-01.XML in your CSDB folder.

3.1 Adding DMRL entries

Each entry in the DMRL describes a data module that is planned to be created, giving the data module code, title, security classification and responsible entity:

```
<dmlContent>
<dmlEntry>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="MYPRJ" systemDiffCode="A" systemCode="00"</pre>
subSystemCode="0" subSubSystemCode="0" assyCode="00"
disassyCode="00" disassyCodeVariant="A" infoCode="040"
infoCodeVariant="A" itemLocationCode="D"/>
</dmRefIdent>
<dmRefAddressItems>
<dmTitle>
<techName>My project</techName>
<infoName>Description</infoName>
</dmTitle>
</dmRefAddressItems>

<security securityClassification="01"/>
<responsiblePartnerCompany>
<enterpriseName>khzae.net</enterpriseName>
</responsiblePartnerCompany>
</dmlEntry>
```

</dmlContent>

The XML for the dmRef of each entry can be quickly generated using the s1kd-ref tool:

\$ s1kd-ref DMC-MYPRJ-A-00-00-00A-040A-D

3.2 Populating the CSDB from the DMRL

Once the DMRL is prepared, the **s1kd-dmrl** tool can be used to automatically populate the CSDB based on the CSDB objects listed in the DMRL:

\$ s1kd-dmrl DML-MYPRJ-NCAGE-C-2017-00001_000-01.XML

Information not included in the DMRL entry for a CSDB object is pulled from the .defaults file (and the .dmtypes file for data modules).

The DMRL should be updated throughout the lifecycle of a project. When new entries are added, simply use the **s1kd-dmrl** tool again to create the newly added data modules. Already existing data modules will not be overwritten, unless the -f option is specified. The -q option will suppress those messages indicating that a data module that already exists will not be overwritten:

\$ s1kd-dmrl -q DML-MYPRJ-NCAGE-C-2017-00001_000-02.XML

3.3 Creating CSDB objects on-the-fly

Data modules and other CSDB objects can also be created in an "on-the-fly" manner, without the use of a DMRL, by invoking the s1kd-new* set of tools directly, as with s1kd-newdml above. For example, to create a new data module:

\$ s1kd-newdm -# MYPRJ-A-00-00-00A-040A-D

This would create the file DMC-MYPRJ-A-00-00-00A-040A-D_000-01_EN-CA.XML in your CSDB folder.

Each of the s1kd-new* tools has various options for setting specific metadata, and information not included as arguments to these commands is pulled from the .defaults and .dmtypes files.

4 Data module workflow

Data modules are put through the general S1000D workflow with the **s1kd-upissue** tool. Whenever a data module will be changed, the s1kd-upissue tool should first be used to indicate the forthcoming change, creating the next inwork issue of the data module.

4.1 Inwork data modules

To increment the inwork issue of a data module, the s1kd-upissue tool is called without any additional options:

\$ s1kd-upissue DMC-MYPRJ-A-00-00-00-00A-040A-D 000-01 EN-CA.XML

Assuming this data module was just created, it would be incremented from initial inwork issue 000-01 to initial inwork issue 000-02. After upissuing, make the changes. For example:

DMC-MYPRJ-A-00-00-00-00A-040A-D_000-01_EN-CA.XML:

```
<content>
<description>
<levelledPara>
<title>General</title>
<para>This is my project.</para>
</levelledPara>
</description>
</content>
```

DMC-MYPRJ-A-00-00-00-00A-040A-D_000-02_EN-CA.XML:

```
<content>
<description>
<levelledPara>
<title>General</title>
<para>This is my project.</para>
<para>My project is maintained using S1000D.</para>
</levelledPara>
</description>
</content>
```

4.2 Making data modules official

Before a data module can be made official, it must be validated. This means:

- It is a valid XML file
- It is valid according to the relevant S1000D schema
- It is valid according to the relevant business rules
- The actual narrative (content) is correct

4.2.1 Validating against the schema

The first two points can be verified with the **s1kd-validate** tool. This tool will indicate any problems with the data module in terms of XML syntax and its correctness regarding its S1000D schema:

```
$ s1kd-validate DMC-MYPRJ-A-00-00-00A-040A-D_000-03_EN-CA.XML
```

4.2.2 Validating against a BREX data module

The third point can be verified using the **s1kd-brexcheck** tool. This tool will indicate any places where a data module violates computable business rules as specified in a Business Rules Exchange (BREX) data module.

```
$ s1kd-brexcheck DMC-MYPRJ-A-00-00-00-00A-040A-D_000-03_EN-CA.XML
```

The BREX allows a project to customize S1000D, for example, by disallowing certain elements or attributes:

<structureObjectRule>

```
<objectPath allowedObjectFlag="0">//emphasis</objectPath>
<objectUse>The emphasis element is not allowed.</objectUse>
</structureObjectRule>
```

Or by tailoring the allowed values of certain elements or attributes:

```
<structureObjectRule>
<objectPath allowedObjectFlag="2">
//@securityClassification
</objectPath>
<objectUse>
The security classification must be 01 (Unclassified)
or 02 (Classified).
</objectUse>
<objectUse>
<objectValue valueAllowed="01">Unclassified</objectValue>
<objectValue valueAllowed="02">Classified</objectValue>
</structureObjectRule>
```

Each data module references the BREX it should be checked against, and BREX data modules can reference other BREX data modules to create a layered set of business rules, for example, Project-related rules and Organization-related rules.

Unless otherwise specified, data modules will reference the S1000D default BREX, which contains a base set of business rules.

To get started with your project's own business rules, you can create a simple BREX data module based on the current defaults of your CSDB using the -B option of the s1kd-newdm tool:

```
$ s1kd-newdm -B# MYPRJ-A-00-00-00A-022A-D
```

This will use the customized .defaults and .dmtypes files to generate a basic set of business rules.

4.2.3 Quality assurance verification

In contrast to the first three points, which can be verified automatically, the last point is generally not an automatic process, and involves quality assurance testing by a human. That a data module has been first or second QA tested can be indicated with the s1kd-upissue tool:

```
$ s1kd-upissue -1 tabtop -2 ttandoo ...
```

Once the data module is validated, the s1kd-upissue tool is used to make it official with the -i option:

```
$ s1kd-upissue -i DMC-MYPRJ-A-00-00-00A-040A-D_000-03_EN-CA.XML
```

4.3 Changes to official data modules

When a change must be made to an official data module (for example, as a result of feedback), the s1kd-upissue tool is used again to bring the data module back to the inwork state:

```
$ s1kd-upissue DMC-MYPRJ-A-00-00-00-00A-040A-D_001-00_EN-CA.XML
```

Changes between official issues of a data module are indicated with reasons for update and change marking. For example:

```
DMC-MYPRJ-A-00-00-00-00A-040A-D_001-00_EN-CA.XML:
```

```
<content>
<description>
<levelledPara>
<title>General</title>
<para>This is my project.
<para>My project is maintained using S1000D.</para>
</levelledPara>
</description>
</content>
DMC-MYPRJ-A-00-00-00A-040A-D_001-01_EN-CA.XML:
<dmStatus issueType="changed">
<!-- ..... -->
<reasonForUpdate id="rfu-0001">
<simplePara>Added reference to tools used.</simplePara>
</reasonForUpdate>
</dmStatus>
<!-- .... -->
<content>
<description>
<levelledPara>
<title>General</title>
<para>This is my project.</para>
<para changeType="modify" changeMark="1"</pre>
reasonForUpdateRefIds="rfu-0001">My project is maintained using
S1000D and s1kd-tools.</para>
</levelledPara>
</description>
</content>
```

Reasons for update from the previous official issue are automatically removed when upissuing to the first inwork issue.

4.4 Deleting data modules

The basic cycle continues until a data module is deleted. "Deleting" a data module is a special case of upissuing:

```
$ s1kd-upissue -is deleted ...
```

The data module is upissued to the next official issue, and it's issue type is set to "deleted".

Deleted data modules may be reinstated later in a similar way:

```
$ s1kd-upissue -is rinstate-status ...
```

The data module is once again upissued to the next official issue, and the issue type is set to one of the "rinstate-x" types.

5 Building publications

S1000D publications are managed by use of publication modules. Like data modules, publication modules may be created as part of the project's DMRL:

```
<dmlEntry>
<pmRef>
<pmRefIdent>
<pmCode modelidentCode="MYPRJ" pmIssuer="12345" pmNumber="00001"</pre>
pmVolume="00"/>
</pmRefIdent>
<pmRefAddressItems>
<pmTitle>My publication</pmTitle>
</pmRefAddressItems>
</pmRef>
<responsiblePartnerCompany>
<enterpriseName>khzae.net</enterpriseName>
</responsiblePartnerCompany>
</dmlEntry>
or "on-the-fly" with the s1kd-newpm tool:
$ s1kd-newpm -# MYPRJ-12345-00001-00
```

5.1 Publication module content

The publication module lays out the hierarchical structure of the data modules in a publication:

```
<content>
<pmEntry>
<pmEntryTitle>Front matter/pmEntryTitle>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="MYPRJ" systemDiffCode="A" systemCode="00"</pre>
subSystemCode="0" subSubSystemCode="0" assyCode="00" disassyCode="00"
disassyCodeVariant="A" infoCode="001" infoCodeVariant="A"
itemLocationCode="D"/>
</dmRefIdent>
<dmRefAddressItems>
<dmTitle>
<techName>My project</techName>
<infoName>Title page</infoName>
</dmTitle>
</dmRefAddressItems>
</dmRef>
</pmEntry>
<pmEntry>
<pmEntryTitle>General info</pmEntryTitle>
```

```
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="MYPRJ" systemDiffCode="A" systemCode="00"</pre>
subSystemCode="0" subSubSystemCode="0" assyCode="00" disassyCode="00"
disassyCodeVariant="A" infoCode="040" infoCodeVariant="A"
itemLocationCode="D"/>
</dmRefIdent>
<dmRefAddressItems>
<dmTitle>
<techName>My project</techName>
<infoName>Description</infoName>
</dmTitle>
</dmRefAddressItems>
</dmRef>
</pmEntry>
</content>
```

5.2 Creating a customized publication

The S1000D applicability model and the **s1kd-instance** tool enable the creation of customized publications, which are filtered for a particular customer or product. For example, a data module may contain applicability for two versions of a product:

```
<para>
This is some common information about the product.
</para>
<para applicRefId="app-versionA">
This information only applies to version A.
</para>
<para applicRefId="app-versionB">
This information only applies to version B.
</para></para>
```

When you deliver this data module to a customer with Version B, you can exclude information which is not applicable to them by filtering it:

```
$ s1kd-instance -s version:prodattr=B <DM>
```

To filter a whole publication, use the -O option of the s1kd-instance tool to output multiple filtered objects into a directory:

```
$ s1kd-instance -s version:prodattr=B -O customerB DMC-*.XML
```

The newly created customerB directory will contain the filtered versions of these data modules.

If your CSDB contains multiple, separate publications, the **s1kd-refs** tool can be used to select only those data modules which apply to a particular publication module:

```
$ s1kd-refs -s <PM> |
> xargs s1kd-instance -s version:prodattr=B -O customerB
```

The above command will filter the publication module and all included data modules, and output the resulting objects to the customerB directory.

6 Use with other version control systems

The issue/inwork numbers and S1000D file naming conventions as seen above provide a basic form of version control. In this case, each file represents a single issue of a CSDB object, and multiple files together represent the whole logical object. For example, all of the following files represent different versions of the same object:

- DMC-MYPRJ-A-00-00-00-00A-040A-D_000-01_EN-CA.XML
- DMC-MYPRJ-A-00-00-00A-040A-D_000-02_EN-CA.XML
- DMC-MYPRJ-A-00-00-00A-040A-D_001-00_EN-CA.XML

However, if you prefer to use an existing version control system such as Git or SVN, it is often more useful for each file to represent a whole object, since these systems typically track changes based on filenames.

The s1kd-tools support an alternate naming convention for this case. Specifying the -N option to certain tools will omit the issue and inwork numbers from filenames of CSDB objects. Taking the s1kd-newdm tool example from above, but adding the -N option as follows:

```
$ s1kd-newdm -N# MYPRJ-A-00-00-00A-040A-D
```

would create the file DMC-MYPRJ-A-00-00-00A-040A-D_EN-CA.XML in your CSDB folder. The s1kd-upissue tool works similarly:

```
$ s1kd-upissue -Ni DMC-MYPRJ-A-00-00-00A-040A-D_EN-CA.XML
```

The issue and inwork numbers are updated in the XML metadata, but instead of creating a new file, the original is overwritten. The previous inwork issues are therefore stored as part of the external version control's history, rather than as individual files.

s1kd-tools .defaults file identifiers

Description

1 General

This document summarizes the compatibility between the s1kd-tools and each issue of the S1000D specification for which support is planned.

[empty] Support is planned but not yet implemented.

X Support is implemented.

/ Support is partially implemented.

Support is not planned. Usually this is because older issues

of the specification did not cover the function of the tool.

Note

Although a tool may not directly support an issue of S1000D, it may still be possible to use with that issue.

For example, the s1kd-brexcheck tool is said not to support Issue 2.0 or Issue 2.1, because the BREX data module schema was not introduced until Issue 2.2. However, an Issue

2.2 or greater BREX data module can still be used to check Issue 2.0 or Issue 2.1 CSDB objects.

Table 2 Compatibility with supported issues of S1000D

None		

Description

1 General

The **s1kd-defaults** tool generates a basic .defaults file for a new CSDB, which is used by several of the other s1kd-tools to determine default values for S1000D metadata. It also provides a way to convert between the simple text and XML formats of the .defaults, .dmtypes and .fmtypes files.

2 Usage

slkd-defaults [-DdFfisth?] [-b <BREX>] [-j <map>] [<file>...]

3 Options

-b <brex></brex>	Use the specified BREX data module to build the .defaults
	and .dmtypes files. This can be used both when initializing
	a new CSDB (-i) or either file can be generated from a BREX

data module separately.

-D Convert a .dmtypes file.
-d Convert a .defaults file.
-F Convert a .fmtypes file.

-f Overwrite the existing file after conversion.

-i Initialize a new CSDB by generating the .defaults, .dmtypes and .fmtypes files in the current directory.

-J Dump the default .brexmap file to stdout.

-j <map> Use a custom .brexmap file to map a BREX DM to a

.defaults or .dmtypes file.

-s Sort the entries alphabetically for either file/output format.

-t Output using the simple text format. Otherwise, the XML

format is used by default.

-h -? Show help/usage message.
--version Show version information.

<file>... Names of files to convert. If none are specified, the default

names of .defaults (for the -d option), .dmtypes (for the -D option) or .fmtypes (for the -F option) in the current

directory are used.

3.1 .brexmap file

This file specifies a mapping between BREX structure object rules and .defaults and .dmtypes files. The path to an object can be written in many different ways in a BREX rule, so the .brexmap file allows any project's BREX to be used to generate these files without having to modify the BREX data module itself.

By default, the program will search for a file named .brexmap in the current directory and parent directories, but any file can be specified using the -j option. If there is no .brexmap file and the -j option is not specified, a default mapping will be used.

Example of .brexmap file:

```
<brexMap>
<dmtypes path="//@infoCode"/>
<default path="//@languageIsoCode" ident="languageIsoCode"/>
<default path="//@countryIsoCode" ident="countryIsoCode"/>
</brexMap>
```

4 Examples

4.1 Initialize a new CSDB, using the XML format

- \$ mkdir mycsdb
- \$ cd mycsdb
- \$ s1kd-defaults -i

4.2 Initialize a new CSDB, using the simple text format

- \$ mkdir mycsdb
- \$ cd mycsdb
- \$ s1kd-defaults -ti

4.3 Generate a custom-named .defaults file

\$ s1kd-defaults > custom-defaults.xml

4.4 Convert a simple text formatted file to XML

\$ s1kd-defaults -df

4.5 Sort entries and output in text format

\$ s1kd-defaults -dts custom-defaults.txt

s1kd-dmrl

S1KDTOOLS-A	-30-00-00-00A-040A-D	s1kd-defaults - Description
		Description

1 General

The **s1kd-newdm** tool creates a new S1000D data module with the data module code and other metadata specified.

2 Usage

s1kd-newdm [options]

3 Options

-# <DMC>

The data module code of the new data module.

-\$ <issue> Specify which issue of S1000D to use. Currently supported

issues are:

4.2 (default)

- 4.1

- 4.0

- 3.0

- 2.3

- 2.2

- 2.1

- 2.0

-@ <filename> Save the new data module as <filename> instead of an

automatically named file in the current directory.

-% <dir> Use XML templates in the specified directory instead of the

built-in templates.

-~ <dir> Dump the built-in XML templates to the specified directory.

-, Dumps the built-in default .dmtypes XML. This can be used

to quickly set up a starting point for a project's custom info codes, from which info names can be modified and unused

codes can be removed to fit the project.

Dumps the simple text form of the built-in default .dmtypes.

-! Do not include an info name for the new data module.

-B When creating a new BREX data module, use the

 $.\mathtt{defaults}$ and $.\mathtt{dmtypes}$ files to add a basic set of context

rules.

-b <BREX> BREX data module code.

-C <country> The country ISO code of the new data module.

-c <sec> The security classification of the new data module.

-D <dmtypes> Specify the .dmtypes file name.
-d <defaults> Specify the .defaults file name.

-f Overwrite existing file.

-I <date> Issue date of the new data module in the form of YYYY-MM-

DD.

-i <info> The info name of the new data module.

-j <map> Use a custom .brexmap file when using the -B option.

-k <skill> The skill level code of the new data module.

-L <language SO code of the new data module.

-M <SNS> Determine the tech name from on one of the built-in S1000D

maintained SNS. Supported SNS:

- Generic
- Support and training equipment
- Ordnance
- General communications
- Air vehicle, engines and equipment
- Tactical missiles
- General surface vehicles
- General sea vehicles

When creating a BREX data module, this SNS will be included as the SNS rules of the new data module. The "maintainedSns" .defaults file key can be used to set one of the above SNS as the default.

-m <remarks>

Set remarks for the new data module.

-N

Omit issue/inwork numbers from filename. The

"omitIssueInfo" .defaults file key can also be set to

control this option.

-n <issue>

The issue number of the new data module.

-O <CAGE>

The CAGE code of the originator.

-o <orig>

The originator enterprise name of the new data module.

-P

When determining tech name from an SNS (-S or -M), include the previous level of SNS in the tech name. This means that:

- tech names derived from a subsystem will be formatted as "System - Subsystem"
- tech names derived from a subsubsystem will be formatted as "Subsystem - Subsubsystem"
- and tech names derived from an assembly will be formatted as "Subsubsystem - Assembly".

If both levels have the same title, then only one will be used. The "includePrevSnsTitle" .defaults file key can also be set to control this option.

-p

Prompts the user for any values left unspecified.

-q

Do not report an error when the file already exists.

-R <CAGE>

The CAGE code of the responsible partner company.

-r <RPC>

The responsible partner company enterprise name of the new

data module.

-S <BREX>

Determine the tech name from the SNS rules of a specified BREX data module. This can also be specified in the

.defaults file with the key "sns".

-s <schema>

The schema URL.

-T <schema>

The type (schema) of the new data module. Supported schemas:

- application appli
- brdoc Business rule document
- brex Business rule exchange
- checklist Maintenance checklist
- comrep Common information repository
- condcrossreftable Conditions cross-reference table
- container Container
- crew Crew/Operator information
- descript Descriptive
- fault Fault information
- frontmatter Front matter
- ipd Illustrated parts data
- learning Technical training information
- prdcrossreftable Product cross-reference table
- proced Procedural
- process Process
- sb Service bulletin
- schedul Maintenance planning information
- scocontent SCO content information
- techrep Technical repository (replaced by comrep in issue 4.1)
- wrngdata Wiring data
- wrngflds Wiring fields

-t <tech> The tech name of the new data module.

-v Print the file name of the newly created data module.

-w <inwork> The inwork number of the new data module.

--version Show version information.

3.1 Prompt (-p) option

If this option is specified, the program will prompt the user to enter values for metadata which was not specified when calling the program. If a piece of metadata has a default value (from the .defaults and .dmtypes files), it will be displayed in square brackets [] in the prompt, and pressing Enter without typing any value will select this default value.

3.2 .defaults file

This file sets default values for each piece of metadata. By default, the program will search the current directory and parent directories for a file named .defaults, but any file can be specified by using the -d option.

All of the s1kd-new* commands use the same .defaults file format, so this file can contain default values for multiple types of metadata.

Each line consists of the identifier of a piece of metadata and its default value, separated by whitespace. Lines which do not match a piece of metadata are ignored, and may be used as comments. Example:

Alternatively, the .defaults file can be written using an XML format, containing a root element defaults with child elements default which each have an attribute ident and an attribute value.

```
<?xml version="1.0"?>
<defaults>
<!-- General -->
<default ident="countryIsoCode" value="CA"/>
<default ident="languageIsoCode" value="en"/>
<default ident="originator" value="khzae.net"/>
<default ident="responsiblePartnerCompany" value="khzae.net"/>
<default ident="securityClassification" value="01"/>
</defaults>
```

3.3 .dmtypes file

This file sets the default type (schema) for data modules based on their info code. By default, the program will search the current directory and parent directories for a file named .dmtypes, but any file can be specified by using the -D option.

Each line consists of an info code, a schema identifier, and optionally a default info name. Example:

```
000 descript
022 brex Business rules
040 descript Description
520 proced Remove procedure
```

Like the .defaults file, the .dmtypes file may also be written in an XML format, where each child has an attribute infoCode, an attribute schema, and optionally an attribute infoName.

```
<?xml version="1.0">
```

```
<dmtypes>
<type infoCode="000" schema="descript"/>
<type infoCode="022" schema="brex" infoName="Business rules"/>
<type infoCode="040" schema="descript" infoName="Description"/>
<type infoCode="520" schema="proced" infoName="Remove procedure"/>
</dmtypes>
```

Info code variants can also be given specific default schema and info names. To do this, include the variant with the info code:

```
258A proced Other procedure to clean
258B proced Other procedure to clean, Clean with air
258C proced Other procedure to clean, Clean with water
```

The two forms of info codes (with and without variant) can be mixed. Defaults are chosen in the order they are listed in the .dmtypes file. An info code with no variant matches all possible variants.

3.4 .brexmap file

Refer to <u>S1KDTOOLS-A-30-00-00-00A-040A-D</u> for a description of the .brexmap file.

3.5 Custom XML templates (-%)

A minimal set of S1000D templates are built-in to this tool, but customized templates may be used with the -% option. This option takes a path to a directory where the custom templates are located. Each template should be named <schema>.xml, where <schema> is the name of the schema, matching one of the schema names in the .dmtypes file or the schema specified with the -T option.

The templates must be written to conform to the default S1000D issue of this tool (currently 4.2). They will be automatically transformed when another issue is specified with the -\$ option.

The templates default can also be specified in the .defaults file to use these custom templates by default.

4 Example

```
$ s1kd-newdm -# S1KDTOOLS-A-00-07-00-00A-040A-D
```

S1KDTC	OOLS-A-0	7-00-00-00A-040A-D	s1kd-newdm - Description		

Description

1 General

The **s1kd-newupf** tool creates a new S1000D data update file for two specified issues of a CIR data module. Changes to items between the source and target issues of the CIR are recorded in the resulting UPF, along with update instructions.

2 Usage

slkd-newupf [options] <SOURCE> <TARGET>

3 Options

-@ <filename></filename>	Save the new UPF as <filename> instead of an automatically named file in the current directory.</filename>
-\$ <issue></issue>	Specify which issue of S1000D to use. Currently supported issues are:

4.2 (default)

- 4.1

-% <dir> Use XML template in the specified directory instead of the

built-in template. The template must be named ${\tt update.xml}$

in the directory <dir>, and must conform to the default

S1000D issue of this tool (4.2).

-~ <dir> Dump the built-in XML template to the specified directory.

-d <defaults> Specify the .defaults file name.

-f Overwrite existing file.

-q Do not report an error when the file already exists.

-v Print the file name of the newly created data update file.

--version Show version information.

<SOURCE> The source (original) issue of the CIR data module.

<TARGET> The target (updated) issue of the CIR data module.

3.1 .defaults file

Refer to $\underline{\text{S1KDTOOLS-A-07-00-00A-040A-D}}$ for information on the .defaults file which is used by all the s1kd-new* commands.

	4			
List of t	ables			1
			References	
			Table 1 References	
Data modu	ule/Tecl	nnical publication	Title	
None				

Description

1 General

The **s1kd-Is** tool searches the current directory or specified directory trees and lists the file names of CSDB objects matching certain criteria.

The files representing the CSDB objects must use either the standard S1000D file naming conventions, or the alternate naming convention supported by these tools using the -N option.

2 Usage

s1kd-ls [-0CDGIiLlMNoPRrwX] [<object>|<dir> ...]

3 Options

Output a null-delimited list of CSDB object paths.
 -C, -D, -G, -L, -M, -P, -X
 List comments, data modules, ICNs, data management lists, ICN metadata files, publication modules, and data dispatch

notes respectively. If none are specified, -CDGLMPX is

assumed.

-h -? Show the usage message.

Show only inwork issues of objects (inwork != 00).
 Show only official issues of objects (inwork = 00).
 Show only the latest official/inwork issue of objects.

-N Assume that the files being listed do not include the issue info

in their filenames, i.e. they were created using the -N option

of the s1kd-new* tools.

-o Show only old official/inwork issues of objects.

-R Show only non-writable object files.
 -r Recursively descend in to directories.
 -w Show only writable object files.

--version Show version information.

<object>|<dir> ...
An optional list of CSDB objects to list or directories to search

for CSDB objects in. If none are specified, CSDB objects in

the current directory are listed by default.

4 Example

```
$ s1kd-ls
```

DMC-EX-A-00-00-00-00A-040A-D_000-01_EN-CA.XML DMC-EX-A-00-00-00-00A-040A-D_000-02_EN-CA.XML DMC-EX-B-00-00-00-00A-040A-D_000-01_EN-CA.XML

List of t	ables	· S		
			References	
			Table 1 References	
Data mod	ule/Tec	hnical publication	Title	
None				

Description

1 General

The **s1kd-ref** tool generates the XML for S1000D reference elements using the specified code or filename. When using a filename, it can parse the CSDB object to include the issue, language, and/or title information in the reference.

2 Usage

3 Options

-\$ <issue></issue>	Output XML for the specified issue of S1000D.
-d	Include the issue date in the reference (target must be a file)
-f	Overwrite source data module instead of writing to stdout.

-h -?	Show the usage message.
-i	Include the issue information in the reference (target must be a file)
-1	Include the language information in the reference (target must be a file)
-o <dst></dst>	Output to <dst> instead of stdout.</dst>
-r	Add the generated reference to the source data module's refs table and output the modified data module to stdout.
-S <sic></sic>	Specify a source data module <src> to add references to when using the -r option.</src>
-t	Include the title in the reference (target must be a file).
version	Show version information.
<code> <filename></filename></code>	Either a code, including the prefix (DMC, PMC, etc.), or the filename of a CSDB object.

s1kd-metadata

Description

Table of contents			
	References Description		
	4 Example	3	
List	of tables		
	1 References	1	
		References	
		Table 1 References	
Data r	module/Technical publication	Title	
None			
		Description	
1	General The s1kd-metadata tool provides a simple way to fetch and change metadata on S1000D CSDB objects.		
2	Usage		
	s1kd-metadata [options	s] [<object>]</object>	
3	Options		
	-0	Print a null-delimited list of values of the pieces of metadata specified with -n, or all available metadata if -n is not specified.	
	-c <file></file>	Use <file> to edit metadata files. <file> consists of lines starting with a metadata name, followed by whitespace,</file></file>	

	followed by the new value for the metadata (the program uses this same format when outputting all metadata if no <name> is specified).</name>
-e	When showing all metadata, only list editable items. This is useful when creating a file for use with the -c option.
-F <fmt></fmt>	Print a formatted line for each CSDB object. Metadata names surrounded with % (e.g. %issueDate%) will be substituted by the value read from the object.
-f	When editing metadata, overwrite the object. The default is to output the modified object to stdout.
-H	Lists all available metadata with a short description of each. Specify specific metadata to describe with the -n option.
-I	Treat input as a list of object filenames to read or edit metadata on, rather than an object itself.
-n <name></name>	The name of the piece of metadata to fetch. This option can be specified multiple times to fetch multiple pieces of metadata. If -n is not specified, all available metadata names are printed with their values. This output can be sent to a text file, edited, and then specified with the -c option as a means of editing metadata in any text editor.
-q	Quiet mode. Non-fatal errors such as a missing piece of optional metadata in an object will not be printed to stderr.
-T	Do not format columns in output.
-t	Print a tab-delimited list of values of the pieces of metadata specified with -n, or all available metadata if -n is not specified.
-v <value></value>	When following a -n option, this specifies the new value for that piece of metadata.
	When following a -w or -W option, this specifies the value to compare that piece of metadata to.
	Each -n, -w, or -W can be followed by -v to edit or define conditions on multiple pieces of metadata.
-W <name></name>	Show or edit metadata only on objects where the value of <name> is not equal to the value specified in the following -v option.</name>
-w <name></name>	Show or edit metadata only on objects where the value of <name> is equal to the value specified in the following -v option.</name>
version	Show version information.
<object></object>	The object(s) to show/edit metadata on. The default is to read from stdin.

Description

1 General

The **s1kd-sns** tool can be used to automatically organize data modules in a CSDB in to a directory hierarchy based on a specified SNS structure. It may also be used to simply print an indented text version of an SNS structure.

2 Usage

```
s1kd-sns [-d <dir>] [-cmnpsh?] [<BREX> ...]
```

3 Options

-C	Copy files in to the SNS subfolders instead of linking them.
-d <dir></dir>	The root directory of the new SNS structure. By default, the tool will use the name "SNS" in the current directory.
-h -?	Show usage message.

-m Move files in to the SNS subfolders instead of linking them.
 -n Use only the SNS codes when naming directories. By default, each directory will be named in the form of "snsCode - snsTitle".
 -p Print the SNS structure only.
 -s Use symbolic links to organize the SNS instead of the default hard links.
 --version Show version information.
 <BREX> Read the SNS structure from the specified BREX data

module. If none is specified, the tool will read from stdin.

4 Example

```
$ s1kd-sns DMC-S1000D-A-08-02-0100-00A-022A-D_EN-US.XML

	Refer	ences ription		1 1
	2 3 3.1 4	Usage Options Identity template		1 1 2
List o	of tables	3		
	1	References		1
			References	
			Table 1 References	
Data m	nodule/Ted	chnical publication	Title	
None				
			Description	
1	Applie	General Applies an XSLT stylesheet to S1000D CSDB objects. The DTD of any specified objects is preserved in the resulting output, which leaves external entities such as ICN references intact.		
2	2 Usage			
	s1kd		<pre>stylesheet> [-p <name>=<value>]] sfile>] [-filh?] [<object>]</object></value></name></pre>	
3	Opt	ions		
	-f		Overwrite the specified CSDB object(s) instead of w stdout.	riting to
	-h -?		Show usage message.	

-i Includes an "identity" template in to each specified stylesheet.

-I Treat input (stdin or arguments) as lists of CSDB objects to

transform, rather than CSDB objects themselves.

-o <file> Output to <file> instead of stdout. This option only makes

sense when the input is a single CSDB object.

-p <name>=<value> Pass a parameter to the last specified stylesheet.

-s <stylesheet> An XSLT stylesheet file to apply to each CSDB object.

Multiple stylesheets can be specified by supplying this argument multiple times. The stylesheets will be applied in

the order they are listed.

--version Show version information.

<object> ... Any number of CSDB objects to apply all specified

stylesheets to.

3.1 Identity template

The -i option includes an "identity" template in to each stylesheet specified with the -s option. The template is equivalent to this XSL:

```
<xsl:template match="@*|node()">
<xsl:copy>
<xsl:apply-templates select="@*|node()"/>
</xsl:copy>
</xsl:template>
```

This means that any attributes or nodes which are not matched by a more specific template in the user-specified stylesheet are copied.

4 Example

```
$ s1kd-transform -s <XSL> <DM1> <DM2> ...
```

s1kd-upissue

Description

Table of	f conte	nts	Page
		ion	
		Ces	
	Descripti	ion	
	1	General

	3	Options	
	4	Examples	
	4.1	Data module with issue/inwork in filename	
	4.2	Data module without issue/inwork in filename	
	4.3	Non-XML file with issue/inwork in filename	3
List of t	ables	References	1
		References Table 1 References	
Data mode None	ule/Techn	nical publication Title	

Description

1 General

The s1kd-upissue tool increases the in-work or issue number of an S1000D CSDB object.

Any files using an S1000D-esque naming convention, placing the issue and in-work numbers after the first underscore (_) character, can also be "upissued". Files which do not contain the appropriate S1000D metadata are simply copied.

2 Usage

3 Options

-i

-1

-q

-R

-r

-1 <type>

-2 <type></type>	Set second verification type (tabtop, onobject, ttandoo).
-c <reason></reason>	Add a reason for update to the upissued objects. Multiple RFUs can be added by specifying this option multiple times.
-d	Do not actually create or modify any files, only print the name of the file that would be created or modified.
-f	Overwrite existing upissued CSDB objects.
-H	Mark the last specified reason for update (-c) as a highlight.
-I	Do not change issue date. Normally, when upissuing to the next inwork or official issue, the issue date is changed to the current date. This option will keep the date of the previous

inwork or official issue.

Increase the issue number of the CSDB object. By default,
the in-work issue is increased

Treat input (stdin or arguments) as lists of CSDB objects to	
upissue, rather than CSDB objects themselves.	

Set first verification type (tabtop, onobject, ttandoo).

-N	Omit issue/inwork numbers from filename.

Keep quality assurance information from old issue. Normally,
when upissuing an official CSDB object to the first in-work
issue, the quality assurance is set back to "unverified".
Specify this option to indicate the upissue will not affect the
contents of the CSDB object, and so does not require it to be
re-verified.

Delete only change markup on elements associated with an
RFU (by use of the attribute reasonForUpdateRefIds.
Change markup on other elements is ignored.

Keep old RFUs. Normally, when upissuing an offical CSDB
object to the first in-work issue, any reasons for update
are deleted automatically, along with any change markup
attributes on elements (when change type is "add" or
"modify") or the elements themselves (when change type is
"doloto"). This ention provents their dolotion

"delete"). This option prevents their deletion.

-s <status> Set the status of the new issue. Default is 'chang</status>	ed'.
---	------

-t <urt></urt>	Set the updateReasonType of	the last specified reason for

update (-c).

v Print the file name of the upissued CSDB object.

--version Show version information.

<file>... Any number of CSDB objects or other files to upissue. If

none are specified, the object will be read from stdin and the

upissued object will be written to stdout.

4 Examples

4.1 Data module with issue/inwork in filename

s1kd-brexcheck Description

Table of	of con	tents	Page
	Refer	ription rences	
List of	tables	S	
	1	References	1
		References	
		Table 1 References	
Data mo	dule/Ted	chnical publication Title	
None			

Description

1 General

The **s1kd-brexcheck** tool validates S1000D CSDB objects using the context, SNS, and/ or notation rules of one or multiple BREX data modules. All errors are displayed with the <objectUse> message, the line number, and a representation of the invalid XML tree.

2 Usage

3 Options

-1

-B	Check each input object against the appropriate built-in
	S1000D default BREX only. The actual BREX reference of

each object is ignored.

-b
brex> Check the CSDB objects against this BREX. Multiple BREX

data modules can be specified by adding this option multiple times. When no BREX data modules are specified, the BREX data module referenced in
brexDmRef> in the CSDB object

is attempted to be used instead.

-c When a context rule defines values for an object

(objectValue), check if the value of each object is within the

allowed set of values.

-d <dir> Directory to start searching for BREX data modules in. By

default, the current directory is used.

-f Print the filenames of CSDB objects with BREX/SNS errors.

-h -? Show the help/usage message.

-I <path> Add a search path for BREX data modules. By default, only

the current directory is searched.

-L Treat input as a list of object filenames to check, rather than

an object itself.

Use the layered BREX concept. BREX data modules

referenced by other BREX data modules (either specified with -b or referenced by the specified CSDB objects) will also be

checked against.

-n Check notation rules. Any notation names listed in any of the

BREX data modules with attribute allowedNotationFlag

set to "1" or omitted are considered valid notations. If a notation in a CSDB object is not present or has

allowedNotationFlag set to "0", an error will be returned.

For notations not included but not explicitly excluded, the objectUse of the first inclusion rule will be returned with the error. For explicitly excluded notations, the objectUse of the

explicit exclusion rule is returned.

-p Display a progress bar.

-q Quiet mode. No errors are printed, they are only indicated via

the exit status.

-r Search for BREX data modules recursively.

-S[tu] Check SNS rules. The SNS of each specified data module

is checked against the combination of all SNS rules of all

specified BREX data modules.

-s Use shortened, single-line messages to report BREX errors

instead of multiline indented messages.

-T Print a summary of the check after it completes, including

statistics on the number of documents that passed/failed the

check.

-v Verbose mode. The success or failure of each test is printed

explicitly

-w <severities> Specify a list of severity levels for business rules.

-x Output an XML report.--version Show version information.

3.1 Business rule severity levels (.brseveritylevels)

The attribute <code>brSeverityLevel</code> on a BREX rule allows for distinguishing different kinds of errors. The <code>.brseveritylevels</code> file contains a list of severity levels, their user-defined type, and optionally if they should not be counted as true errors (causing the tool to return a "failure" status) but merely warnings.

By default, the program will search the current directory and parent directories for a file named .brseveritylevels, but any file can be specified by using the -w option.

An example of the format of this file is given below:

```
<?xml version="1.0"?>
<brSeverityLevels>
<brSeverityLevel value="brsl01" fail="yes">Error</brSeverityLevel>
<brSeverityLevel value="brsl02" fail="no">Warning</brSeverityLevel>
</brSeverityLevels>
```

When the attribute fail has a value of "yes" (or is not included), BREX errors pertaining to rules with the given severity level value will be counted as errors. When it is "no", the errors are still displayed but are not counted as errors in the exit status code of the tool.

3.2 Normal, strict and unstrict SNS check (-S, -St, -Su)

There are three modes for SNS checking: normal, strict, and unstrict. The main difference between them is how they handle the optional levels of an SNS description in the BREX.

-St enables **strict** SNS checking. By default, the normal SNS check (-S) will assume optional elements snsSubSystem, snsSubSystem, and snsAssy exist with an snsCode of "0" ("00" or "0000" for snsAssy) when their parent element does not contain any of each. This provides a shorthand, such that

```
<snsSystem>
<snsCode>00</snsCode>
<snsTitle>General</snsTitle>
</snsSystem>
```

is equivalent to

```
<snsSystem>
<snsCode>00</snsCode>
```

```
<snsTitle>General</snsTitle>
<snsSubSystem>
<snsCode>0</snsCode>
<snsTitle>General</snsTitle>
<snsSubSubSystem>
<snsCode>0</snsCode>
<snsTitle>General</snsTitle>
<snsAssy>
<snsCode>00</snsCode>
<snsTitle>General</snsTitle>
<snsAssy>
<snsCode>00</snsCode>
<snsTitle>General</snsTitle>
</snsAssy>
</snsSubSubSystem>
</snsSubSubSystem>
</snsSubSystem>
</snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem></snsSystem>
```

Using strict checking will disable this shorthand, and missing optional elements will result in an error.

-Su enables **unstrict** SNS checking. The normal SNS check (-S) shorthand mentioned above only allows SNS codes of "0" to be omitted from the SNS rules. Using unstrict checking, **any** code used will not produce an error when the relevant optional elements are omitted. This means that given the following...

```
<snsSystem>
<snsCode>00</snsCode>
<snsTitle>General</snsTitle>
</snsSystem>
```

...SNS codes of 00-00-0000 through 00-ZZ-ZZZZ are considered valid.

3.3 Object value checking (-c)

There are two ways to restrict the allowable values of an object in a BREX rule. One is to use the XPath expression itself. For example, this expression will match any securityClassification attribute whose value is neither "01" nor "02", and because the allowedObjectFlag is "0", will generate a BREX error if any match is found:

```
<objectPath allowedObjectFlag="0">
//@securityClassification[
. != '01' and
. != '02'
]
</objectPath>
```

However, this method can lead to fairly complex expressions and requires a reversal of logic. The BREX schema provides an alternative method using the element objectValue:

```
<structureObjectRule>
<objectPath allowedObjectFlag="2">
//@securityClassification
</objectPath>
```

```
<objectValue valueAllowed="01">Unclassified</objectValue>
<objectValue valueAllowed="02">Classified</objectValue>
</structureObjectRule>
```

Specifying the -c option will enable checking of these types of rules, and if the value is not within the allowed set a BREX error will be reported. The valueForm attribute can be used to specify what kind of notation the valueAllowed attribute will contain:

- "single" A single, exact value.
- "range" Values given in the S1000D range/set notation, e.g. "a~c" or "a|b|c".
- "pattern" A regular expression.

The s1kd-brexcheck tool supports all three types. If the valueForm attribute is omitted, it will assume the value is in the "single" notation.

4 Exit status

0	Check completed successfully, and no CSDB objects had BREX errors.
1	Check completed successfully, but some CSDB objects had BREX errors.
2	One or more BREX data modules could not be read.
3	One or more CSDB objects specified could not be read.
4	An XPath expression given for a BREX rule was invalid.
5	The number of paths or CSDB objects specified exceeded the available memory.

5 Example

```
$ DMOD=DMC-EX-A-00-00-00-00A-040A-D_000-01_EN-CA.XML
$ BREX=DMC-S1000D-F-04-10-0301-00A-022A-D_001-00_EN-US.XML
$ cat $DMOD
[...]
<listItem id="stp-0001">
<para>List items shouldn't be used as steps...
</listItem>
[...]
<para>Refer to <internalRef internalRefId="stp-0001"</pre>
internalRefTargetType="irtt08"/>.</para>
[...]
$ s1kd-brexcheck -b $BREX $DMOD
BREX ERROR: DMC-EX-A-00-00-00-00A-040A-D_000-01_EN-CA.XML
 BREX: DMC-S1000D-F-04-10-0301-00A-022A-D_001-00_EN-US.XML
  Only when the reference target is a step can the value of attribute
internalRefTargetType be irtt08 (Chap 3.9.5.2.1.2, Para 2.1).
```

```
line 52 (/dmodule[1]/content[1]/description[1]/para[2]/
internalRef[1]):
    ELEMENT internalRef
    ATTRIBUTE internalRefTargetType
        TEXT
        content=irtt08
    ATTRIBUTE internalRefId
    TEXT
        content=stp-0001
```

Example of XML report format for the above:

```
<?xml version="1.0"?>
<bre>check>
<document path="DMC-EX-A-00-00-00-00A-040A-D 000-01 EN-CA.XML">
<brev path="DMC-S1000D-F-04-10-0301-00A-022A-D_001-00_EN-US.XML">
<error fail="yes">
<objectPath allowedObjectFlag="0">...</objectPath>
<objectUse>Only when the reference target is a step can the value of
attribute internalRefTargetType be irtt08
(Chap 3.9.5.2.1.2, Para 2.1).</objectUse>
<object line="52"</pre>
xpath="/dmodule[1]/content[1]/description[1]/para[2]/internalRef[1]">
<internalRef internalRefId="stp-0001"</pre>
internalRefTargetType="irtt08"/>
</object>
</error>
</brex>
</document>
</brexCheck>
```

Description

1 General

The **s1kd-refs** tool lists external references in CSDB objects, optionally matching them to a filename in the CSDB directory hierarchy. This makes it easy to obtain a list of dependencies for CSDB objects, such as ICNs, to ensure they are delivered together, or to check for references to CSDB objects which do not exist in the current CSDB.

2 Usage

s1kd-refs [-aCcDEffGilNnPqRrsUuXxh?] [-d <dir>] [<object>...]

3 Options

-a -C, -D, -E, -G, -P List all references, both matched and unmatched.

List references to comments, data modules, external publications, ICNs, and publication modules respectively. If none are specified, -CDEGP is assumed.

-c	List references in the content section of a CSDB object only.
-d <dir></dir>	Directory to search for matches to references in. By default, the current directory is used.
-F	When using the -U or -X options, overwrite the input objects that have been updated or tagged.
-f	Include the filename of the source object where each reference was found in the output.
-h -?	Show help/usage message.
-i	Ignore issue and language info when matching references.
-1	Treat input (stdin or arguments) as lists of filenames of CSDB objects to list references in, rather than CSDB objects themselves.
-N	Assume filenames of referenced CSDB objects omit the issue info, i.e. they were created with the -N option to the s1kd-new* tools.
-n	Include the filename of the source object where each reference was found, and display the line number where the reference occurs in the source file after its filename.
-q	Quiet mode. Errors are not printed.
-R	List references in matched objects recursively.
-r	Search for matches to references in directories recursively.
-S	Include the source object as a reference. This is helpful when the output of this tool is used to apply some operation to a source object and all its dependencies together.
-U	Update the address items (such as titles) of matched references from the corresponding object.
-u	Show only unmatched reference errors, or unmatched codes if combined with the -a option.
-X	Tag unmatched references with the processing instruction unmatched? .
-X	Output a detailed XML report instead of plain text messages.
version	Show version information.
<object></object>	CSDB object(s) to list references in. If none are specified, the tool will read from stdin.

4 Example

Applicable to: All

\$ slkd-refs DMC-EX-A-00-00-00-00A-040A-D_000-01_EN-CA.XML DMC-EX-A-00-00-00A-022A-D_001-00_EN-CA.XML DMC-EX-A-01-00-00A-040A-D_000-01_EN-CA.XML

			Description
1		1kd-validate tool valida	tes S1000D CSDB objects, checking whether they are valid XML nst their own S1000D schemas.
2	Usa	ge	
	s1kd	-validate [-d <dir< td=""><td>>] [-X <uri>] [-flqvx] [<object>]</object></uri></td></dir<>	>] [-X <uri>] [-flqvx] [<object>]</object></uri>
3	Opt	ions	
	-d <di< td=""><td>r></td><td>Search for schemas in <dir>. Normally, the URI of the</dir></td></di<>	r>	Search for schemas in <dir>. Normally, the URI of the</dir>

schema is used to fetch it locally or over a network, but

this option will force searching to be performed only in the

specified directory.

This can also be accomplished through the use of XML

catalogs.

-f List invalid files.

-I Treat input as a list of object names to validate, rather than

an object itself.

-v -q Set the verbosity of the output, verbose or quiet. Verbose will

explictly indicate success, rather than simply not displaying

any errors. Quiet will not output anything.

-X <URI> Exclude an XML namespace from the validation. Elements in

the namespace specified by <URI> are ignored.

-x Do XInclude processing before validation.

--version Show version information.

<object>... Any number of CSDB objects to validate. If none are

specified, input is read from stdin.

3.1 Multi-spec directory with -d option

The -d option can point either to a directory containing the XSD schema files for a single S1000D spec (i.e. the last part of the schema URI), or to a directory containing schemas for multiple specs. The latter must follow a particular format for the tool to locate the appropriate schemas for a given spec:

```
schemas/ <-- The directory passed to -d
S1000D_4-1/
    xml_schema_flat/
      [4.1 XSD files...]
S1000D_4-2/
    xml_schema_flat/
      [4.2 XSD files...]</pre>
```

3.2 XML catalogs vs. -d option

XML catalogs provide a more standard method of redirecting public, network-based resources to local copies. As part of using libxml2, there are several locations and environment variables from which this tool will load catalogs.

Below is an example of a catalog file which maps the S1000D schemas to a local directory:

```
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
<rewriteURI uriStartString="http://www.s1000d.org/"
rewritePrefix="/usr/share/slkd/schemas/"/>
</catalog>
```

This can be placed in a catalog file automatically loaded by libxml2 (e.g., /etc/xml/catalog) or saved to a file which is then specified in an environment variable used by libxml2 (e.g., XML_CATALOG_FILES) to remove the need to use the -d option.

4 Example

\$ s1kd-validate DMC-EX-A-00-00-00-00A-040A-D_000-01_EN-CA.XML

s1kd-acronyms

Description

Table	Page

	Desc	ription		
	1			
	2			
	3			
	3.1			
	4			
LIST O	f tables			1
			References	
			Table 1 References	
Data mo	odule/Ted	chnical publication	Title	
None				

Description

1 General

The **s1kd-acronyms** tool is used to manage acronyms in S1000D data modules in one of three ways:

- Generate a list of unique acronyms used in all specified data modules.
- Mark up acronyms automatically based on a specified list.
- Remove acronym markup.

2 Usage

s1kd-acronyms -D [-f1] [-o <file>] [<dmodule>...]

3 Options

-1

-d Format XML output as an S1000D <definitionList>.

-f When marking up acronyms with the -m option, overwrite the

input data modules instead of writing to stdout.

-h -? Show help/usage message.

-i -l -! Markup acronyms in interactive mode. If the specified acronyms list contains multiple definitions for a given

acronym term, the tool will prompt the user with the context in which the acronym is used and present a list of the definitions

for them to choose from.

When not in interactive mode, the first definition found will be

used.

The -I option prompts for all acronyms, not just those with multiple definitions. This can be useful if some occurrences of

the acronym term should be ignored.

The -! option will not prompt for acronyms, instead it will markup where acronyms are found using a

<chooseAcronym> element, whose child elements are all
possible acronyms matching the term. Another program can

then use this as input to actually prompt the user.

Treat input (stdin or arguments) as lists of filenames of data

modules to find or markup acronyms in, rather than data

modules themselves.

-M Like the -m option, but use a custom list of acronyms instead

of the default .acronyms file.

-m Instead of listing acronyms in the specified data modules,

automatically markup acronyms in the data module using the

.acronyms file.

-n <#> Minimum number of spaces after the term in pretty-printed

text output.

-o <file> Output to <file> instead of stdout.

-p Pretty print text/XML acronym list output.

-T <types> Only search for acronyms with an attribute acronymType

whose value is contained within the string <types>.

-t Format XML output as an S1000D .

-X <xpath> When marking up acronyms with -m/-M, use a custom

XPath expression to specify which text nodes to search for

acronyms in. By default, this is all text nodes in any element where acronyms are allowed. This must be the path to the text() nodes, not the elements, e.g. //para/text() and not

simply //para.

-x Use XML output instead of plain text.

--version Show version information.

<dmodule>... Data modules to find acronyms in. If none are specified, input

is taken from stdin.

3.1 .acronyms file

This file specifies a list of acronyms for a project. By default, the program will search for a file named .acronyms in the current directory and parent directories, but any file can be specified using the -M option.

Example of .acronyms file format:

```
<acronyms>
<acronym acronymType="at01">
<acronymTerm>BREX</acronymTerm>
<acronymDefinition>Business Rules Exchange</acronymDefinition>
</acronym>
<acronym acronymType="at01">
<acronymTerm>SNS</acronymTerm>
<acronymDefinition>Standard Numbering System</acronymDefinition>
</acronym>
</acronyms>
```

4 Examples

List all acronyms used in all data modules:

```
$ s1kd-acronyms DMC-*.XML
```

Markup predefined acronyms in a data module:

```
$ s1kd-acronyms -mf DMC-EX-A-00-00-00A-040A-D_EN-CA.XML
```

Unmarkup acronyms in a data module:

```
$ slkd-acronyms -Df DMC-EX-A-00-00-00-00A-040A-D EN-CA.XML
```

Description

1 General

The **s1kd-aspp** tool has two main functions:

- Generates display text for applicability statements. The text is derived from the logic described by the assert and evaluate elements.
- Preprocesses "semantic" applicability statements in a data module to produce
 "presentation" applicability statements which are simpler to parse in an XSLT stylesheet.

"Semantic" applicability statements are those entered by the author to encode the applicability of elements within a data module. "Presentation" applicability statements are those that are actually displayed in page-oriented output, also referred to as the "human-readable" statements.

The applicability in the resulting XML is longer semantically correct, but an XSLT stylesheet can simply place a statement on any element with attribute applicRefId without needing to consider inherited applicability statements on elements without the attribute.

2 Usage

3 Options

-A <act></act>	Add an ACT to use when	generating display text for product
----------------	------------------------	-------------------------------------

attributes. Multiple ACT data modules can be used by

specifying this option multiple times.

-a <ID> The ID to use for the inline applicability annotation

representing the whole data module's applicability. Default is

"applic-0000".

-C <CCT> Add a CCT to use when generating display text for

conditions. Multiple CCT data modules can be used by

specifying this option multiple times.

-c Search for the ACT and CCT referenced by each data

module, and add them to the list of ACTs/CCTs to use when

generating display text for that data module.

-D Dump the built-in XSLT used to generate display text for

applicability statements.

-d <dir> Directory to start searching for ACT/CCT data modules in. By

default, the current directory is used.

-f Overwrite input data module(s) rather than outputting to

stdout.

-G <XSLT> Use custom XSLT to generate display text for applicability

statements.

-g Generate display text for applicability statements.

-I Treat input (stdin or arguments) as lists of filenames of

objects, rather than objects themselves.

-p Preprocess applicability statements to produce "presentation"

applicability statements which are simpler to parse in an XSLT stylesheet. The applicability in the resulting XML is no

longer semantically correct.

-r Search for ACT/CCT data modules recursively.

-x Process the objects using the XInclude specification.

--version Show version information.

<object>... The object(s) to preprocess. This can include both individual

objects and combined files such as those produced by s1kd-

flatten(1).

4 Examples

4.1 Generating display text

The built-in XSLT for generating display text follows the guidance in Chap 7.8 of the S1000D 4.2 specification. For example, given the following:

```
<applic>
<assert applicPropertyIdent="prodversion" applicPropertyType="prodattr"
applicPropertyValues="A"/>
</applic>
```

The resulting XML would contain:

```
<applic>
<displayText>
<simplePara>prodversion: A</simplePara>
</displayText>
<assert applicPropertyIdent="prodversion" applicPropertyType="prodattr"
applicPropertyValues="A"/>
</applic>
```

If ACTs or CCTs are supplied which define display names for a property, this will be used instead of the ident. For example, the ACT defines the display name for the "prodversion" product attribute:

When supplied with the -A option:

```
$ s1kd-aspp -g -A <ACT> <DM>
```

The resulting XML would instead contain:

```
<applic>
<displayText>
<simplePara>Version: A</simplePara>
<assert applicPropertyIdent="prodversion" applicPropertyType="prodattr"
applicPropertyValues="A"/>
</displayText>
</applic>
```

The methods for generating display text can be changed by supplying a custom XSLT script with the -G option. The -D option can be used to dump the built-in XSLT as a starting point for a custom script. An identity template is automatically added to the script, equivalent to the following:

```
<xsl:template match="@*|node()">
<xsl:copy>
<xsl:apply-templates select="@*|node()"/>
</xsl:copy>
</xsl:template>
```

This means any elements or attributes not matched by a more specific template in the script are copied.

4.2 Creating presentation applicability statements

Given the following:

```
<dmodule>
<identAndStatusSection>
<dmAddress>...</dmAddress>
<dmStatus>
. . .
<applic>
<displayText>
<simplePara>A or B</simplePara>
</displayText>
</applic>
</dmStatus>
</identAndStatusSection>
<content>
<referencedApplicGroup>
<applic id="applic-B">
<displayText>
<simplePara>B</simplePara>
</displayText>
</applic>
</referencedApplicGroup>
cedure>
<preliminaryRqmts>...</preliminaryRqmts>
<mainProcedure>
ceduralStep>
<para>This step is applicable to A or B.</para>
</proceduralStep>
ceduralStep applicRefId="applic-B">
<para>This step is applicable to B only.</para>
ceduralStep applicRefId="applic-B">
<para>This step is also applicable to B only.</para>
ceduralStep>
ceduralStep>
<para>This step is also applicable to A or B.</para>
</proceduralStep>
</mainProcedure>
```

```
<closeRqmts>...</closeRqmts>
</procedure>
</content>
</dmodule>
```

Applicability statements should be displayed whenever applicability changes:

- 1 This step is applicable to A or B.
- 2 Applicable to: B

This step is applicable to B only.

- 3 This step is also applicable to B only.
- 4 Applicable to: A or B

This step is also applicable to A or B.

There are two parts which are difficult to do in an XSLT stylesheet:

- No statement is shown on Step 3 despite having attribute applicRefId because the
 applicability has not changed since the last statement on Step 2.
- A statement is shown on Step 4 despite not having attribute applicRefId because the
 applicability has changed back to that of the whole data module.

Using the s1kd-aspp tool, the above XML would produce the following output:

```
<dmodule>
<identAndStatusSection>
<dmAddress>...</dmAddress>
<dmStatus>
. . .
<applic>
<displayText>
<simplePara>A or B</simplePara>
</displayText>
</applic>
</dmStatus>
</identAndStatusSection>
<content>
<referencedApplicGroup>
<applic id="applic-B">
<displayText>
<simplePara>B</simplePara>
</displayText>
</applic>
<applic id="applic-0000">
<displayText>
<simplePara>A or B</simplePara>
```

```
</displayText>
</applic>
</referencedApplicGroup>
cedure>
<preliminaryRqmts>...</preliminaryRqmts>
<mainProcedure>
ceduralStep>
<para>This step is applicable to A or B.</para>
ceduralStep>
ceduralStep applicRefId="applic-B">
<para>This step is applicable to B only.</para>
</proceduralStep>
ceduralStep>
<para>This step is also applicable to B only.</para>
</proceduralStep>
ceduralStep applicRefId="applic-0000">
<para>This step is also applicable to A or B.</para>
</mainProcedure>
</procedure>
</content>
</dmodule>
```

With attribute applicRefId only on those elements where a statement should be shown, and an additional inline applicability to represent the whole data module's applicability. This XML is semantically incorrect but easier for a stylesheet to transform for page-oriented output.

s1kd-flatten

Description

Table of	f con	tents		Page
	Descr	iption		
	Descr	intion		
	1			
	2			
	3	Options		1
	4	Example		2
List of t	ables			1
	ı	References		
			References	
			Table 1 References	
Data module/Technical publication		hnical publication	Title	
None				

Description

1 General

The **s1kd-flatten** tool combines a publication module and the data modules it references in to a single file for use with a publishing system.

Data modules are by default searched for in the current directory using the data module code, language and/or issue info provided in each reference.

2 Usage

```
s1kd-flatten [-d <dir>] [-I <path>] [-cDfNpRrx] <PM> [<DM>...]
```

3 Options

-C

Flatten referenced container data modules by copying the references inside the container directly in to the publication module. The copied references will also be flattened, unless the -d option is specified.

-D	Remove unresolved references, but do not flatten resolved

ones.

-d <dir> Directory to start search in. By default, the current directory is

used.

-f Overwrite input publication module instead of writing to

stdout.

-h -? Show help/usage message.

-I <path> Add <path> to the list of directories that the tool will search

when resolving references.

-N Assume that the files representing the referenced data

modules do not include the issue info in their filenames, i.e. they were created using the -N option of the s1kd-new* tools.

-p Instead of the hierarchical PM-based format, use a simpler

"flat" format.

-R Recursively flatten referenced publication modules, copying

their content in to the "master" publication module.

-r Search directories recursively.

-x Use XInclude rather than copying each data module's

contents directly inside the publication module. DTD entities in data modules will only be carried over to the final publication when using this option, otherwise they do not

carry over when copying the data module.

--version Show version information.

<DM>... When using the -p option, the filenames to include can

be specified manually as additional arguments instead of searching for them in the current directory. When not using

the -p option, additional arguments are ignored.

<PM> The publication module to flatten.

4 Example

\$ s1kd-flatten -x PMC-EX-12345-00001-00_001-00_EN-CA.XML > Book.xml

s1kd-fmgen

Description

Table of	f cont	tents	Page
	Refere	ption General Usage Options fmtypes file	
List of t	ables	· i	1
	ı	ivererences	References Table 1 References
Data mod	ule/Tec	hnical publication	Title
INOTIE			

Description

1 General

The **s1kd-fmgen** tool generates the content section for front matter data modules from either a standard publication module, or the combined format of the s1kd-flatten(1) tool. Some front matter types require the use of the combined format, particularly those that list information not directly found in the publication module, such as the highlights (HIGH) type.

2 Usage

```
s1kd-fmgen [-F <FMTYPES>] [-P <PM>] [-X <XSL> [-p <name>=<val> ...]]
        [-,.fhx?] (-t <TYPE>|<DM>...)
```

3 Options

- Dump the built-in .fmtypes XML format.
- -. Dump the built-in .fmtypes simple text format.

-h -? Show usage message.

-F <FMTYPES> Specify a custom .fmtypes file.

-f Overwrite the specified front matter data module files after

generating their content.

-I Treat input (stdin or arguments) as lists of front matter data

modules to generate content for, rather than data modules themselves. If reading list from stdin, the -P option must be

used to specify the publication module.

-P <PM> Publication module or s1kd-flatten(1) PM format file to

generate contents from. If none is specified, the tool will read

from stdin.

-p <name>=<value> Pass a parameter to the XSLT specified with the -X option.

-t <TYPE> Generate content for this type of front matter when no data

modules are specified. Supported types are:

HIGH - Highlights

LOEDM - List of effective data modules

TOC - Table of contents

TP - Title page

-X <XSL> Transform the front matter contents after generating them

using the specified XSLT. This can be used, for example, to generate content for a descriptive schema data module instead, to support older issues of the specification, or for types of generated front matter not covered by the frontmatter

schema.

-x Do XInclude processing.

--version Show version information.

<DM>... Front matter data modules to generate content for.

3.1 .fmtypes file

This file specifies a list of info codes to associate with a particular type of front matter. By default, the program will search for a file named .fmtypes in the current directory and parent directories, but any file can be specified using the -F option.

Example of simple text format:

001 TP 009 TOC 00S LOEDM 00U HIGH

Example of XML format:

<fmtypes>

```
<fm infoCode="001" type="TP"/>
<fm infoCode="009" type="TOC"/>
<fm infoCode="00S" type="LOEDM"/>
</fmtypes>
```

4 Example

Generate the content for a title page front matter data module and overwrite the file:

```
$ s1kd-flatten PMC-EX-12345-00001-00_001-00_EN-CA.XML |
> s1kd-fmgen -f DMC-EX-A-00-00-00A-001A-D_001-00_EN-CA.XML
```

s1kd-icncatalog Description

Table o	of con	itents	Page
	Refere	riptionencesription	1
	1 2	GeneralUsage	
	3 4 4.1	Options Examples Resolving ICNs to filenames	2 2
	4.2 5	Alternative ICN formatsCatalog schema	3
	5.1 5.2 5.3	CatalogNotationMedia	4
	5.4 5.5	ICNExample ICN catalog	
List of	tables	S	
	1	References	1
		References	
		Table 1 References	
Data mod	dule/Tec	chnical publication Title	
None			

Description

1 General

The **s1kd-icncatalog** tool is used to manage a catalog of ICNs for a project, and to resolve ICNs using this catalog. Resolving an ICN means placing the actual filename of the ICN in to the SYSTEM ID of the ENTITY declaration within CSDB objects.

2 Usage

Applicable to: All

s1kd-icncatalog [options] [<object>...]

3 Options

-a <ICN> Add an ICN to the catalog. Follow with the -u and -n options

to specify the URI and notation to use for this ICN. The -m

option specifies a media group to add the ICN to.

-c <catalog> Specify the catalog file to manage or resolve against. By

default, the file .icncatalog in the current directory is used. If the current directory does not contain this file, the parent

directories will be searched.

-d <ICN> Delete an ICN from the catalog. The -m option specifies a

media group to delete the ICN from.

-f Overwrite the input CSDB objects when resolving ICNs, or

overwrite the catalog file when modifying it. Otherwise, output

is written to stdout.

-I Treat input (stdin or arguments) as lists of filenames of CSDB

objects, rather than CSDB objects themselves.

-m <media> Resolve ICNs for this intended output media. The catalog

may contain alternative formats for the same ICN to be used

for different output media.

-n <notation> Specify the notation to reference when adding an ICN with

the -a option.

-t Create a new empty catalog.

-u <URI> Specify the URI when adding an ICN with the -a option.

-x Process input CSDB objects using the XInclude specification.

--version Show version information.

4 Examples

4.1 Resolving ICNs to filenames

A CSDB object may reference an ICN as follows:

```
<!NOTATION png SYSTEM "png">
<!ENTITY ICN-TEST-00001-001-01 SYSTEM "ICN-TEST-00001-001-01.PNG"
NDATA png>
```

The SYSTEM ID of this ENTITY indicates that the ICN file will be in the same directory relative to the CSDB object. However, the ICN files in this example are located in a separate folder called 'graphics'. Rather than manually updating every ENTITY declaration in every CSDB object, a catalog file can be used to map ICNs to actual filenames:

```
<icnCatalog>
<icn infoEntityIdent="ICN-TEST-00001-001-01"
uri="graphics/ICN-TEST-00001-001-01.PNG"/>
</icnCatalog>
```

Then, using this tool, the ICN can be resolved against the catalog:

```
$ s1kd-icncatalog -c <catalog> <object>
```

Producing the following output:

```
<!NOTATION png SYSTEM "png">
<!ENTITY ICN-TEST-00001-001-01 SYSTEM
"graphics/ICN-TEST-00001-001-01.PNG" NDATA png>
```

4.2 Alternative ICN formats

A catalog can also be used to provide alternative file formats for an ICN depending on the intended output media. For example:

```
<icnCatalog>
<notation name="jpg" systemId="jpg"/>
<notation name="svg" systemId="svg"/>
<media name="pdf">
<icn infoEntityIdent="ICN-TEST-00001-001-01"
uri="ICN-TEST-00001-001-01.JPG" notation="jpg"/>
</media>
<media name="web">
<icn infoEntityIdent="ICN-TEST-00001-001-01"
uri="ICN-TEST-00001-001-01.SVG" notation="svg"/>
</media>
</icnCatalog>
```

The -m option allows for specifying which type of media to resolve for:

```
<!NOTATION png SYSTEM "png">
<!ENTITY ICN-TEST-00001-001-01 SYSTEM "ICN-TEST-00001-001-01.PNG"
NDATA png>

$ s1kd-icncatalog -c <catalog> -m pdf <object>

<!NOTATION png SYSTEM "png">
<!NOTATION jpg SYSTEM "jpg">
<!NOTATION jpg SYSTEM "jpg">
<!ENTITY ICN-TEST-00001-001-01 SYSTEM "ICN-TEST-00001-001-01.JPG"
NDATA jpg>

$ s1kd-icncatalog -c <catalog> -m web <object>

<!NOTATION png SYSTEM "png">
<!NOTATION png SYSTEM "png">
<!NOTATION svg SYSTEM "svg">
<!ENTITY ICN-TEST-00001-001-01 SYSTEM "ICN-TEST-00001-001-01.SVG"
NDATA svg>
```

5 Catalog schema

The following describes the schema of an ICN catalog file.

5.1 Catalog

Markup element: <icnCatalog>

Attributes:

None

Child elements:

- <notation>
- <media>
- <icn>

5.2 Notation

The element <notation> represents a NOTATION declaration.

Markup element: <notation>

Attributes:

- name, the NDATA name.
- publicId, the optional PUBLIC ID of the notation.
- systemId, the optional SYSTEM ID of the notation.

Child elements:

None

5.3 Media

The element <media> groups a set of alternative ICN formats for a particular output media type.

Markup element: <media>

Attributes:

name, the identifier of the output media.

Child elements:

- <icn>

5.4 ICN

The element <icn> maps an ICN to a filename and optionally a notation. When this element occurs as a child of a <media> element, it will be used when that output media is specified with the -m option. When it occurs as a child of <icnCatalog>, it will be used if no media is specified.

Markup element: <icn>

Attributes:

infoEntityIdent, the ICN

- uri, the filename the ICN will resolve to
- notation, a reference to a previously declared <notation> element.

Child elements:

- None

5.5 Example ICN catalog

```
<icnCatalog>
<notation name="jpg" systemId="jpg"/>
<notation name="png" systemId="png"/>
<notation name="png" systemId="png"/>
<notation name="svg" systemId="svg"/>
<media name="pdf">
<icn infoEntityIdent="ICN-TEST-00001-001-01"
uri="ICN-TEST-00001-001.JPG" notation="jpg"/>
</media>
<media name="web">
<icn infoEntityIdent="ICN-TEST-00001-001-01"
uri="ICN-TEST-00001-001-01.SVG" notation="svg"/>
</media>
<icn infoEntityIdent="ICN-TEST-00001-001-01"
uri="ICN-TEST-00001-001-01.PNG" notation="png"/>
</icnCatalog>
```

s1kd-index

Description

Table of contents

			Table 1 References	
Data ı	module/Ted	chnical publication	Title	
None				
			Description	
1			ndex flags to a data module based on a user-defined set of	
2	Usa	ge		
	s1kd	-index -h? -index [-I <index -index -D [-fil]</index 	<pre>x>] [-fil] [<module>] [<module>]</module></module></pre>	
3	Opt	ions		
	-D		Remove the current index flags from a data module.	
	-f		Overwrite input module(s).	

-I <index> Flag the terms in the specified <index> XML file instead of

the default .indexflags file.

-i Ignore case when flagging terms.

-I Treat input (stdin or arguments) as lists of filenames of data

modules to add index flags to, rather than data modules

themselves.

-h -? Show help/usage message.
--version Show version information.

3.1 .indexflags file

This file specifies the list of indexable keywords for the project and their level. By default, the program will search for a file named .indexflags in the current directory or parent directories, but any file can be specified using the -I option.

Exmaple of .indexflags file format:

```
<indexFlags>
<indexFlag indexLevelOne="bicycle"/>
<indexFlag indexLevelOne="bicycle" indexLevelTwo="brake system"/>
</indexFlags>
```

4 Example

Given the following in a data module:

```
<levelledPara>
<title>General</title>
<para>
The slkd-tools are a set of small tools for manipulating S1000D XML
data.
</para>
</levelledPara>
And the following .indexflags file:
<indexFlags>
```

```
<indexFlags>
<indexFlag indexLevelOne="S1000D"/>
<indexFlag indexLevelTwo="S10000D" indexLevelTwo="s1kd-tools"/>
<indexFlag indexLevelOne="data"/>
<indexFlag indexLevelOne="data" indexLevelTwo="XML"/>
</indexFlags>
```

Then the s1kd-index command:

```
$ s1kd-index <DM>.XML
```

Would result in the following:

<levelledPara>

<title>General</title>
<para>
The slkd-tools<indexFlag indexLevelOne="S1000D"
indexLevelTwo="slkd-tools"/> are a set of small tools for
manipulating S1000D<indexFlag indexLevelOne="S1000D"/>
XML<indexFlag indexLevelOne="data" indexLevelTwo="XML"/>
data<indexFlag indexLevelOne="data"/>.
</para>
</levelledPara>

Description

1 General

The **s1kd-instance** tool produces "instances" of S1000D CSDB objects, derived from "master" (or "source") objects. The tool supports multiple methods of instantiating objects:

- Filtering on user-supplied applicability definitions, so that non-applicable elements and (optionally) unused applicability annotations are removed in the instance. The definitions can be supplied directly or read from a PCT.
- Filtering on skill levels and security classifications to remove sensitive data.
- Using a CIR to produce a standalone instance from a CIR-dependent master.

Any combination of these methods can be used when producing an instance.

The applications for this tool include:

- Delivering customized data modules or publications to different customers.
- Creating customized instances of CSDB objects which are maintained within the CSDB.
- As a backend to filter content or resolve CIR dependencies at runtime in an electronic viewer application.

2 Usage

slkd-instance [options] [<object>...]

3 Options

-A	Simplify inline applicability	annotations and remove un	used
/ \	Onlight with applicability	annotations and remove an	uocu

ones.

-a Remove unused inline applicability annotations.

-C <comment> Add an XML comment to an instance. Useful as another

way of identifying an object as an instance aside from the source address or extended code, or giving additional information about a particular instance. By default, the comment is inserted at the top of the document, but this can

be customized with the -X option.

-c <code> Specify a new data module code (DMC) or publication

module code (PMC) for the instance.

-D <CIR> Dumps the built-in XSLT used to resolve dependencies for

<CIR> CIR type to stdout. This can be used as a starting point for a custom XSLT script to be specified with the -x

option.

The following types currently have built-in XSLT and can

therefore be used as values for <CIR>:

accessPointRepository

applicRepository

cautionRepository

circuitBreakerRepository

controlIndicatorRepository

enterpriseRepository

functionalItemRepository

illustratedPartsCatalog

partRepository

supplyRepository

toolRepository

	warningRepository
	zoneRepository
-d <dir></dir>	Directory to start searching for ACT and PCT data modules in when a product is specified (-p) without specifying the PCT explicitly (-P). By default, the current directory will be searched.
-E	Remove the extension from an instance produced from an already extended object.
-e <ext></ext>	Specify an extension on the data module code (DME) or publication module code (PME) for the instance.
-F	After filtering, "alts" elements containing only one child element will be "flattened" by replacing them with the applicable child element. Alts elements with multiple child elements are left untouched.
-f	Force overwriting of files.
	By itself, this will cause the source object(s) to be overwritten instead of being printed to stdout.
	When used with the -o or -O options, if a file exists with the same name as the one specified (-o) or automatically generated by the tool (-O), this will force it to be overwritten. Otherwise, a warning will be printed and the existing file will not be overwritten.
-G <code>/<name></name></code>	Similar to the -g option, but instead of the default enterprise code and name, use the values <code> and <name>, which are separated by a slash (/). To only include a code, specify <code> with no slash. To only include a name, specify <name> prefixed by a slash.</name></code></name></code>
-g	Set the originator of the instance. When this option is specified, the code "SIKDI" and the name "slkd-instance tool" are used by default to identify that the instance was produced by this tool. A different code and name can be specified with the -G option.
-I <date></date>	Set the issue date of the instance. By default, the issue date is taken from the source. If - is given for <date>, the current date will be used.</date>
-i <infoname></infoname>	Give the data module instance a different infoName.
-j	After filtering, remove external entities (such as ICNs) which are no longer used from the resulting instances.
-K <levels></levels>	Filter the object on the specified skill levels. Elements

which are marked with skill levels not contained in the string

<levels> are removed in the resulting instance.

-k <level> Set the skill level of the instance.

-L Source is a list of object filenames to create instances of,

rather than an object itself.

-I <lang> Set the language and country of the instance. For example,

to create an instance for US English, lang would be "en-US".

-m <remarks> Set the remarks for the instance.

-N Omit issue/inwork numbers from automatically generated

filenames.

-n <iss> Set the issue and inwork numbers of the instance. By default,

the issue and inwork number are taken from the source.

-O <dir> Output instance(s) in <dir>, automatically naming them based

on:

the extension specified with -e

the code specified with -c

The issue info specified with -n

the language and country specified with -L

If any of the above are not specified, the information is copied from the source object.

If <dir> does not exist, it will be created.

If a file exists with the same name in the specified directory, a warning will be display and the file will not be overwritten, unless the -f option is specified.

When using this option, non-XML files, such as external publications, may be specified as objects. They will be copied to <dir>.

-o <file> Output instance to file instead of stdout.

-P <PCT> PCT file to read product definitions from (-p). If a product is

specified but no PCT is given, the tool will attempt to use the ACT reference of each source data module to find the ACT

and PCT data modules in the current directory.

-p -p -p or The ID or primary key of a product in the the specified PCT

data module (-P) or the PCT data module referenced by the source data module. A primary key is given in the same form as the -s option and should match a unique assign of a product instance.

product instance, e.g., "serialno:prodattr=12345"

-R <CIR> ... Use a CIR to resolve external dependencies in the master object, making the instance object standalone. Additional

CIRs can be used by specifying the -R option multiple times.

The following CIRs have some built-in support:

- Access points
- Applicability
- Cautions
- Circuit breakers
- Controls/indicators
- Enterprises
- Functional items
- Illustrated parts data
- Parts
- Supplies
- Tools
- Warnings
- Zones

The methods of resolving the dependencies for a CIR can be changed by specifying a custom XSLT script with the -x option. The built-in XSLT used for the above CIR data modules can be dumped with the -D option.

Search for ACT and PCT data modules recursively when a product is specified (-p) without specifying the PCT explicitly (-P).

Do not include <sourceDmldent>/<sourcePmldent>/ <repositorySourceDmldent> in the instance.

An applicability definition in the form of

"<ident>:<type>=<value>". Any number of values can be defined by specifying this option multiple times.

Give the instance a different techName/pmTitle.

Filter the object on the specified security classes. Elements marked with security classes not contained in the string <classes> are removed in the resulting instance.

Set the security classification of the instance. An instance may have a lower security classification than the source if classified information is removed for a particular customer.

When -O is used, print the automatically generated file name of the instance.

Set the applicability for the whole object, overwriting the

Check the applicability, skill level, and security classification of the whole object against the user-defined applicability, skill

current applicability with the user-defined applicability values.

-S

-s <applic>

-t <techName>

-U <classes>

-u <sec>

-v

-W

-W

	levels, and security classifications. If the whole object is not applicable, then no instance is created.
-X <path></path>	The XPath expression indicating where the comment specified with -C will be inserted. This should be the path to an element where the comment will be inserted as the first child node. By default, this is the top of the document.
-x <xsl></xsl>	Use a custom XSLT script to resolve CIR dependencies for the last specified CIR.
-Y <text></text>	Update the applicability for the whole object using the user- defined applicability values, and using <text> as the new display text.</text>
-у	Update the applicability for the whole object using the user-defined applicability values.
-Z	Fix certain elements automatically after filtering. For example, if all support equipment is removed due to filtering, a <pre><nosupportequips> element will be inserted automatically.</nosupportequips></pre>
version	Show version information.
<object></object>	Source CSDB objects to instantiate.

3.1 Identifying the source of an instance

The resulting data module instances will contain the element <sourceDmldent>, which will contain the identification elements of the source data modules used to instantiate them. Publication module instances will contain the element <sourcePmldent> instead.

Additionally, the data module instance will contain an element <repositorySourceDmldent> for each CIR specified with the -R option.

If the -S option is used, neither the <sourceDmldent>/<sourcePmldent> elements or <repositorySourceDmldent> elements are added. This can be useful when this tool is not used to make an "instance" per se, but more generally to make a module based on an existing module.

3.2 Removing/simplifying applicability annotations (-a vs -A)

By default, filtering on applicability will remove invalid elements from the resulting instance. In some cases, though, it may be desirable to remove redundant applicability annotations on valid elements. The -a and -A options provide two methods of doing this.

The -a option will remove applicability annotations (applicRefld) from elements which are deemed to be unambiguously valid (their validity does not rely on applicability values left undefined by the user). Unused occurrences of the corresponding applic elements are removed as well.

The -A option will do the same as the -a option, but will also attempt to simplify unused parts of applicability annotations. It simplifies an annotation by removing <assert> elements determined to be either unambiguously valid or invalid given the user-defined values, and removing unneeded <evaluate> elements when they contain only one remaining <assert>.

For example, given the following input:

```
<referencedApplicGroup>
<applic id="app-0001">
<assert
applicPropertyIdent="version"
applicPropertyType="prodattr"
applicPropertyValues="A"/>
</applic>
<applic id="app-0002">
<assert
applicPropertyIdent="version"
applicPropertyType="prodattr"
applicPropertyValues="B"/>
</applic>
<applic id="app-0003">
<evaluate andOr="or">
<evaluate andOr="and">
<assert.
applicPropertyIdent="version"
applicPropertyType="prodattr"
applicPropertyValues="A"/>
<assert
applicPropertyIdent="weather"
applicPropertyType="condition"
applicPropertyValues="normal"/>
</evaluate>
<evaluate andOr="and">
<assert
applicPropertyIdent="version"
applicPropertyType="prodattr"
applicPropertyValues="B"/>
<assert
applicPropertyIdent="weather"
applicPropertyType="condition"
applicPropertyValues="icy"/>
</evaluate>
</evaluate>
</applic>
</referencedApplicGroup>
<!-- snip -->
<para applicRefId="app-0001">This applies to version A.
<para applicRefId="app-0002">This applies to version B.</para>
<para applicRefId="app-0003">
This applies to version A if the weather is normal, or version B if
the weather is icy.
</para>
```

If this data is filtered for version A, without specifying a value for the weather, and neither the -a or -A option is used, the following will be the result:

```
<referencedApplicGroup>
<applic id="app-0001">
<assert
applicPropertyIdent="version"
applicPropertyType="prodattr"
applicPropertyValues="A"/>
</applic>
<applic id="app-0002">
<assert
applicPropertyIdent="version"
applicPropertyType="prodattr"
applicPropertyValues="B"/>
</applic>
<applic id="app-0003">
<evaluate andOr="or">
<evaluate andOr="and">
<assert.
applicPropertyIdent="version"
applicPropertyType="prodattr"
applicPropertyValues="A"/>
<assert
applicPropertyIdent="weather"
applicPropertyType="condition"
applicPropertyValues="normal"/>
</evaluate>
<evaluate andOr="and">
<assert
applicPropertyIdent="version"
applicPropertyType="prodattr"
applicPropertyValues="B"/>
<assert
applicPropertyIdent="weather"
applicPropertyType="condition"
applicPropertyValues="icy"/>
</evaluate>
</evaluate>
</applic>
</referencedApplicGroup>
<!-- snip -->
<para applicRefId="app-0001">This applies to version A.</para>
<para applicRefId="app-0003">
This applies to version A if the weather is normal, or version B if
the weather is icy.
</para>
```

The second paragraph is removed, because it only applies to version B.

If the -a option is used, the following would be the result:

```
<referencedApplicGroup>
<applic id="app-0003">
<evaluate andOr="or">
<evaluate andOr="and">
<assert
applicPropertyIdent="version"
applicPropertyType="prodattr"
applicPropertyValues="A"/>
applicPropertyIdent="weather"
applicPropertyType="condition"
applicPropertyValues="normal"/>
</evaluate>
<evaluate andOr="and">
<assert.
applicPropertyIdent="version"
applicPropertyType="prodattr"
applicPropertyValues="B"/>
<assert
applicPropertyIdent="weather"
applicPropertyType="condition"
applicPropertyValues="icy"/>
</evaluate>
</evaluate>
</applic>
</referencedApplicGroup>
<!-- snip -->
<para>This applies to version A.</para>
<para applicRefId="app-0003">
This applies to version A if the weather is normal, or version B if
the weather is icy.
</para>
```

The applicability annotation reference for the first paragraph is removed because, given that the version is A, it must be true. The corresponding applicability annotations, which are no longer referenced, are also removed. The applicability on the third paragraph remains, however, because it is only true if the version is A **and** the weather is normal, and no value has been given for the weather.

If the -A option is used, the following would be the result:

```
<referencedApplicGroup>
<applic id="app-0003">
<assert
applicPropertyIdent="weather"
applicPropertyType="condition"
applicPropertyValues="normal"/>
</applic>
</referencedApplicGroup>
```

```
<!-- snip -->
<para>This applies to version A.</para>
<para applicRefId="app-0003">
This applies to version A if the weather is normal, or version B if the weather is icy.
</para>
```

The annotation is now simplified to remove resolved assertions. Because the version must be A, any assertions restating this can be removed as redundant, and any portions of the annotation in which the version is **not** A can be removed as invalid. This leaves only the assertion about the weather.

Note

The -A option may change the **meaning** of certain applicability annotations without changing the **display text**. Display text is always left untouched, so using this option may cause display text to be technically incorrect. This option is best used when display text will be automatically generated after filtering, such as with the s1kd-aspp tool.

3.3 Applicability of an instance (-W, -Y, -y)

The applicability of an instance may change as a result of filtering. For example, a source data module which is applicable to two versions of a product may produce two instances which are each only applicable to one version. There are three options which control how the applicability of the whole instance object is updated.

The -W option will create an applicability annotation for the instance using only the user-defined applicability values. This means, for example, that given the following command:

```
$ s1kd-instance -s version:prodattr=A -W ...
```

The instance would contain the following annotation:

```
<dmStatus>
<!-- snip -->
<applic>
<assert applicPropertyIdent="version"
applicPropertyType="prodattr" applicPropertyValues="A"/>
</applic>
<!-- snip -->
</dmStatus>
```

regardless of what the applicability of the source object was.

The -y option will create an applicability annotation for the instance by combining the userdefined applicability with the applicability of the source object. For example, given the following annotation in the source object:

```
<dmStatus>
<!-- snip -->
<applic>
<assert applicPropertyIdent="version"</pre>
```

```
applicPropertyType="prodattr" applicPropertyValues="A"/>
</applic>
<!-- snip -->
</dmStatus>
```

and the following command:

```
$ s1kd-instance -s weather:condition=icy -y ...
```

The annotation for the instance would be as follows:

```
<dmStatus>
<!-- snip -->
<applic>
<evaluate andOr="and">
<assert applicPropertyIdent="version"
applicPropertyType="prodattr" applicPropertyValues="A"/>
<assert applicPropertyIdent="weather"
applicPropertyType="condition" applicPropertyValues="icy"/>
</evaluate>
</applic>
<!-- snip -->
</dmStatus>
```

The -Y option by itself works the same as the -y option, but allows custom display text to be set for the annotation. It can also be combined with the -W option to add custom display text to the overwriting annotation:

```
$ slkd-instance -s version:prodattr=A -WY "Version A" ...

<dmStatus>
<!-- snip -->
<applic>
<displayText>
<simplePara>Version A</simplePara>
</displayText>
<assert applicPropertyIdent="version"
applicPropertyType="prodattr" applicPropertyValues="A"/>
</applic>
<!-- snip -->
</dmStatus>
```

3.4 Filtering for multiple values of a single property

Though not usually the case, it is possible to create an instance which is filtered on multiple values of the same applicability property. Given the following:

```
<referencedApplicGroup>
<applic id="apA">
<assert applicPropertyIdent="attr"
applicPropertyType="prodattr"</pre>
```

```
applicPropertyValues="A"/>
</applic>
<applic id="apB">
<assert applicPropertyIdent="attr"</pre>
applicPropertyType="prodattr"
applicPropertyValues="B"/>
</applic>
<applic id="apC">
<assert applicPropertyIdent="attr"</pre>
applicPropertyType="prodattr"
applicPropertyValues="C"/>
</applic>
</referencedApplicGroup>
<!-- ... -->
<para applicRefId="apA">Applies to A</para>
<para applicRefId="apB">Applies to B</para>
<para applicRefId="apC">Applies to C</para>
```

filtering can be applied such that the instance will be applicable to both A and C, but not B. This is done by specifying a property multiple times in the applicability definition arguments. For example:

```
$ s1kd-instance -A -Y "A or C" -s attr:prodattr=A -s attr:prodattr=C ...
```

This would produce the following in the instance:

```
<dmStatus>
<!--->
<applic>
<displayText>
<simplePara>A or C</simplePara>
</displayText>
<evaluate andOr="or">
<assert applicPropertyIdent="attr"</pre>
applicPropertyType="prodattr"
applicPropertyValues="A"/>
<assert applicPropertyIdent="attr"</pre>
applicPropertyType="prodattr"
applicPropertyValues="C"/>
</evaluate>
</applic>
<!-- -->
</dmStatus>
<!-- ... -->
<referencedApplicGroup>
<applic id="apA">
<assert applicPropertyIdent="attr"</pre>
applicPropertyType="prodattr"
applicPropertyValues="A"/>
```

```
</applic>
<applic id="apC">
<assert applicPropertyIdent="attr"
applicPropertyType="prodattr"
applicPropertyValues="C"/>
</applic>
</referencedApplicGroup>
<!-- ... -->
<para applicRefId="apA">Applies to A</para>
<para applicRefId="apC">Applies to C</para></para></para>
```

3.5 Resolving CIR dependencies with a custom XSLT script (-x)

A CIR contains more information about an item than can be captured in a data module's reference to it. If this additional information is required, there are two methods to include it:

- Distribute the CIR with the data module so the extra information can be linked to
- "Flatten" the information to fit in the data module's schema.

A custom XSLT script can be supplied with the -x option, which is then used to resolve the CIR dependencies of the last CIR specified with -R. For example:

```
<xsl:stylesheet
xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
version="1.0">
<xsl:template match="functionalItemRef">
<xsl:variable name="fin" select"@functionalItemNumber"/>
<xsl:variable name="spec" select="//functionalItemSpec[
functionalItemIdent/@functionalItemNumber = $fin]"/>
<xsl:value-of select="$spec/name"/>
</xsl:template>
</xsl:stylesheet>
```

This script would resolve a functionalItemRef by "flattening" it to the value of the name element obtained from the CIR.

The example CIR would contain a specification like:

```
<functionalItemSpec>
<functionalItemIdent functionalItemNumber="ABC"
functionalItemType="fit01"/>
<name>Hydraulic pump</name>
<functionalItemAlts>
<functionalItem/>
</functionalItemAlts>
</functionalItemAlts>
</functionalItemSpec>
```

The source data module would contain a reference:

```
<para>
The
```

```
<functionalItemRef functionalItemNumber="ABC"/>
is an item in the system.
</para>
```

The command would resemble:

```
$ s1kd-instance -R <CIR> -x <custom XSLT> <src>
```

And the resulting XML would be:

```
<para>The Hydraulic pump is an item in the system.</para>
```

The source data module and CIR are combined in to a single XML document which is used as the input to the XSLT script. The root element mux contains two dmodule elements. The first is the source data module, and the second is the CIR data module specified with the corresponding -R option. The CIR data module is first filtered on the defined applicability.

An "identity" template is automatically inserted in to the custom XSLT script, equivalent to the following:

```
<xsl:template match="@*|node()">
<xsl:copy>
<xsl:apply-templates select="@*|node()"/>
</xsl:copy>
</xsl:template>
```

This means any elements or attributes which are not matched with a more specific template in the custom XSLT script are automatically copied.

The set of built-in XSLT scripts used to resolve dependencies can be dumped using the -D option.

4 Exit status

0	No errors
1	Missing or incomplete argument
2	Specified file does not exist
4	Malformed applicability definition
6	XML was invalid or does not conform to S1000D
7	Value given for an argument was malformed
8	Issue date specified with -I is invalid

5 Examples

Filtering a data module on specified applicability and writing to stdout:

```
$ s1kd-instance -s version:prodattr=A <DM>
```

Filtering a data module on a specified product instance and writing to stdout:

\$ s1kd-instance -P <PCT> -p versionA <DM>

Filtering a data module on specified skill levels and writing to stdout:

\$ s1kd-instance -k sk01/sk02 <DMs>

Filtering data modules for a particular customer and outputting with extended identification:

\$ s1kd-instance -s version:prodattr=A -e 12345-54321 -O . <DMs>

Writing out a data module from stdin to a directory with automatic naming:

\$ slkd-transform -s <xsl> <DM> | slkd-instance -SO <dir>

s1kd-neutralize Description

Table of contents					
	Refer	encesiptionGeneralUsageOptions			
List of t	·	S			
			References Table 1 References		
Data mod	ule/Ted	chnical publication	Title		
None					

Description

1 General

Generates neutral metadata for the specified CSDB objects. This includes:

- XLink attributes for references, using the S1000D URN scheme.
- RDF and Dublin Core metadata.

2 Usage

s1kd-neutralize [-o <file>] [-flnh?] [<object>...]

3 Options

-f	Overwrite specified CSDB object(s) automatically.
-h -?	Show usage message.
-l	Treat input (stdin or arguments) as lists of CSDB objects to

neutralize, rather than CSDB objects themselves.

-n Include the IETP namespaces for data module and

publication module elements.

-o <file> Output neutralized CSDB object XML to <file> instead of

stdout.

--version Show version information.

4 Example

```
$ DMOD=DMC-XLINKTEST-A-00-00-00-00A-040A-D_000-01_EN-CA.XML
$ xmllint --xpath "//description/dmRef" $DMOD
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="XLINKTEST" systemDiffCode="A"</pre>
systemCode="00" subSystemCode="0" subSubSystemCode="0" assyCode="01"
disassyCode="00" disassyCodeVariant="A" infoCode="040"
infoCodeVariant="A" itemLocationCode="D"/>
</dmRefIdent>
<dmRefAddressItems>
<dmTitle>
<techName>XLink test</techName>
<infoName>Referenced data module</infoName>
</dmTitle>
</dmRefAddressItems>
</dmRef>
$ s1kd-neutralize $DMOD | xmllint --xpath "//description/dmRef" -
<dmRef xlink:type="simple"</pre>
xlink:href="URN:S1000D:DMC-XLINKTEST-A-00-00-01-00A-040A-D"
xlink:title="XLink test - Referenced data module">

</dmRef>
```

s1kd-syncrefs Description

Table of contents				
	Refe	rencesription		
	1			
	2 3			
	4			
List of	table			1
			References	
			Table 1 References	
Data mo	odule/Te	chnical publication	Title	
None				

Description

1 General

The **s1kd-syncrefs** tool copies all external references (dmRef, pmRef, externalPubRef) within the content of a data module and uses them to generate the <refs> element. Each unique reference is copied, sorted, and placed in to the <refs> element. If a <refs> element already exists, it is overwritten.

2 Usage

s1kd-syncrefs [-dfl] [-o <out>] [<data module>...]

3 Options

-0	Delete the <reis> element.</reis>
-f	Overwrite the data modules automatically.
-1	Treat input (stdin or arguments) as lists of data modules to synchronize references in, rather than data modules themselves.

-o <out> The resulting XML is written to <out> instead of stdout.

--version Show version information.

<data module>... The data module(s) to synchronize references in. Default is to

read from stdin.

4 Example

\$ s1kd-syncrefs -f DMC-EX-A-00-00-00-00A-040A-D_000-01_EN-CA.XML

s1kd-uom

Description

Table of con	tents	Page
Refer Descr 1 2 3 3.1	riptionencesription	
3.2 4 4.1 4.2	Conversion formula variables (-e) Examples Common units of measure Using a custom formula and format	3 3
List of tables	5	
1	References	1
	References	
	Table 1 References	
Data module/Ted	chnical publication Title	
None		
	Description	

1 General

The **s1kd-uom** tool converts between specified units of measure in quantity data, for example, to automatically localize units of measure in data modules.

2 Usage

```
s1kd-uom [-F <fmt>] [-u <uom> -t <uom> [-e <expr>] [-F <fmt>] ...] [-U <path>] [-f1,h?] [<object>...]
```

3 Options

-e <expr>

Specify the formula for a conversion, given as an XPath expression.

-F <fmt></fmt>	Specify the format for quantity values. When used before -u, this specifies the format for all conversions. Otherwise, this specifies the format for each individual conversion.
-f	Overwrite input CSDB objects.

-f Overwrite input CSDB objects
-h -? Show help/usage message.

-I Treat input (stdin or arguments) as lists of filenames of

CSDB objects to list references in, rather than CSDB objects

themselves.

-t <uom> Unit of measure to convert to.
-U <path> Use a custom .uom file.

-u <uom> Unit of measure to convert from.

--version Show version information.

<object> CSDB objects to convert quantities in.

3.1 .uom file

This file contains the rules for converting units of measure. If no specific conversions are given with the -u and -t options, this file also acts as a list of all conversions to perform.

By default, the program will search the current directory and parent directories for a file named .uom, but any file can be specified by using the -U option.

Example of a .uom file:

```
<uom>
<convert from="degF" to="degC" formula="($value - 32) * (5 div 9)"/>
<convert from="in" to="cm" formula="$value * 2.54"/>
<convert from="lbm" to="kg" formula="$value div 2.205"/>
</uom>
```

The tool contains a default set of rules for common units of measure. This can be used to create a default .uom file by use of the -, option:

```
$ s1kd-uom -, > .uom
```

To select only certain common rules when generating a .uom file, the -u and -t options can be used:

```
$ s1kd-uom -, -u in -t cm -u degF -t degC > .uom
```

This will generate a . uom file containing rules to convert inches to centimetres, and degrees Fahrenheit to degrees Celsius.

3.2 Conversion formula variables (-e)

When specifying a formula for conversion, the following variables can be used:

\$pi The constant π

\$value The original quantity value

For example, the formula to convert degrees to radians can be given as follows:

```
$value * ($pi div 180)
```

4 Examples

4.1 Common units of measure

Input:

```
<quantity>
<quantityGroup>
<quantityUnitOfMeasure="cm">15</quantityValue>
</quantityGroup>
</quantity>
```

Command:

```
$ s1kd-uom -u cm -t in <DM>
```

Output:

```
<quantity>
<quantityGroup>
<quantityValue quantityUnitOfMeasure="in">5.91</quantityValue>
</quantityGroup>
</quantity>
```

4.2 Using a custom formula and format

Input:

```
<quantity
quantityType="qty02"
quantityTypeSpecifics="CAD">10.00</quantity>
```

Command:

```
$ s1kd-uom -u CAD -t USD -e '$value div 1.31' -F '0.00'
```

Output:

```
<quantity
quantityType="qty02"
quantityTypeSpecifics="USD">7.36</quantity>
```
